Ian OM,

I'll try to be brief here:

"Naming anyone" who has successfully built a 2KW SMPS: Do you mean someone who has published an article in a ham radio magazine? MANY things have been done, but the builder may never seek to publish an article about it, or make a commercial product out of it. So only he knows about it. There are a lot more builders and designers out there than the number of technical articles in magazines would suggest. I have published an article in a ham radio magazine, once. I am not interested in doing it again. Many, if not most, of us who build, don't spend additional time writing up articles about it. We go on to building the next project, HI.
So, no, I can't name more "references" for you I, except the voluminous amount of material available in the industry from suppliers of devices for SMPS as well as design books dealing with them. My posting was not a research project, after all. There was a QST article some years ago on a SMPS for at least a KW, but I can't recall when.
By the way, for some of us, a KW is a KW, not 2 KW peak. I don't use SSB, for example, just CW and FSK, so a KW is just a KW, with appropriate duty cycle. Gotta be careful about generalizing...
So, for SMPS designs, like the rest of us, you will have to figure it out for yourself from available information. Perhaps you already have, and so 60Hz is a good solution for you, sounds like. This is a hobby after all, and it doesn't have to be cost-effective, or lightweight, or inexpensive even. Just so it is rewarding for the participant.
You mentioned the Feb '91 QEX article by W9QQ having no "long term effect". Judging by what? More published articles and designs? I know of at least one effect: I am fiddling with KW SMPS's. That is the only "effect" that concerns me, actually. You seem to tie usefulness and feasibility of something to the existence of subsequent articles/writeups and/or ham radio products based on it. Ain't necessarily so, especially for us solo reclusive tinkerers :). For

example, there are a number of homebrew DSP-based DC phasing receivers out there in use, being enjoyed by their builders, but you won't find many articles describing them in detail. Again, not all article writers and builders are in the same set.

That is all I have to offer. Now I am reminded of why I should not post, HI. Much better to lurk :).

73 and Happy Building,

Don, W6JL

2. Re: Delay line

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-01 00:00:00 UTC

Adding a bit to what others have already posted (and special thanks to Roy for sharing some insights from his Tek work)...

Another type of delay element I've seen is a large block of quartz: it's roughly circular a few inches in diameter and about an inch thick. (Can you say, "lots of taxpayer dollars"? I knew you could! But hey, no mercury.) The perimeter is actually cut in a large number of flat faces, and an acoustic wave bounces from one face to another, across the block, and back to an adjacent face, going around in a "star" pattern, incurring lots of delay.

I think Roy's post made it particularly clear that the spiral delay line used in (older) color TVs is just an extension of standard coax, where the center conductor gains more inductance by coiling. To a good approximation, Z0 = sqrt(L/C), and the delay time is given by T = sqrt(L*C). But if you want to play with making your own delay line that way, you'll do well to space the turns out, perhaps two wire diameters center-to-center. If you close-wind the helix, there is significant turn-to-turn capacitance that really messes up the response.

I have an interesting variable delay line, which is built like a "helipot", kind of. It has a spiral conductor which I think is wound on a plastic rod. That whole thing is then wound into spiral: imagine the plastic rod about 1/16" diameter, and after it's wound with wire, the assembly is wound on about a 1" diameter rod. Then it's fitted into a spiral groove inside an aluminum tube, which acts as the outer conductor. You feed signal in one end, have a Z0 load on the other end, and a wiper picks off a signal which is fed to a high input impedance amplifier to keep from putting reflections on the line where it taps in. As I recall, the one I have is rated for 0-1usec delay.

Cheers,
Tom

Tom, thanks for the memories. I had forgotten to mention those. They were used for the one-pulse-interval radar delays (around 2.5 ms) when I was fixing the big radars in the mid-60's, and were the replacements for the mercury tubes. As I recall, they had 14 faces. I remember them as being something like 10 or 12 inches in diameter, but that memory might not be reliable. There were transducers on two faces, and the signal (in the form of an acoustic wave) bounced around inside a lot more than 14 times until it finally hit a face at an angle higher than the critical angle, so it could exit. This, of course, was at the face where the output transducer was. I don't recall ever having trouble with one, so although they were undoubtedly very expensive, as you say, they also seemed to be reliable. And they weren't hyper-sensitive to shock like the mercury lines.

Ah, yes, those were the days. I can still smell the PCB-laced transformer oil. I was up to my elbows in it more than once. . .

I'd be a little cautious, since there are more and more 3.3V chips out these days
that might not tolerate 5V.

I think that I'll use a boost circuit to get about 18V - 19V on each grid - pumped inductor with an LM3524- and some HEXFET's for switching. These Agilent ultrabrite's will draw 50ma continuous, more if switched.

It's like the "dog food" problem in grad school - optimizing cost with the number of resistors, transistors etc. Thank goodness I didn't have to be an engineer for a living, Ijust do this for fun.

Why not use a series/parallel grid?
(please excuse the ASCII art ;-)

```
.--------------- + 12 volt DC - ---------------.
| |
| |
| R LED LED LED LED etc. |
.---/\/\/\----->|-->|-->|-->|-->|-->|-->|-->|--.
| |
| R |
.---/\/\/\----->|-->|-->|-->|-->|-->|-->|-->|--.
| |
| R |
.---/\/\/\----->|-->|-->|-->|-->|-->|-->|-->|--.
| |
~ ~
etc. etc.
```

Just put a number of LEDs in series so the total voltage drop is say 9 to 10 volt. Size the resistor to absorb the remainder of the supply voltage (12 minus 9 to 10 volt) while passing the required 20 to 50 mA. ie. 40 to 150 Ohm, depending on the amount of voltage you choose to drop across the resistor & the current you want flowing through the individual branches. Easy! & doesn't use any complicated power supplies. You can, of course, use more or less LEDs and higher or lower supply voltage.

Some of the plastics which are better insulators are much more affected by UV light, and become brittle after a short time in the sun. PVC holds up pretty well. As Ian has pointed out, it's not really particularly lossy at HF. At least one popularized case of PVC melting turned out not to be due to field absorption, but to the temperature of the wire wound on it.

The mechanical properties are at least as important as the electrical ones -- no insulator is much good when it breaks.

12. Re: Delay line

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-01 00:00:00 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <39363BBC.6602747A@eznec.com>
Source record: 60280

Delay lines can take a number of different forms, depending on the frequency, amount of delay, and signal fidelity required. Long period delays, like the online (63 us) lines found in TVs are mechanical. That is, the electrical signal is converted to a mechanical (sound) wave which travels at the speed of sound rather than the speed of light. The sound wave traverses some sort of structure, then is converted back to an electrical signal. These days, SAW (surface acoustic wave) devices are common. In bygone days, radars used a mercury tube delay line with an acoustic wave traveling in it. This provided a one-pulse-interval delay, allowing comparison of a return with the return from the previous pulse, for MTI (moving target indication). In long-range radars, this delay was about 2.5 ms. I recall being told that if one was bumped, it could take hours or even days for it to completely settle back down, but I don't know how true this is. Some years ago, pseudo-stereo devices were popular for car radios. They just delayed one channel relative to the other for a sort of two channel echo effect. These used a spring-like structure carrying a mechanical wave.

Shorter delays are usually done with some sort of transmission line. A common packaged delay line looks like a coil surrounded by or sitting on a ground plane. The coil makes a distributed L and the ground plane a distributed C. The result is a delay line with a relative slow velocity factor -- hence, a relatively long delay for the physical length. The more compact the unit, the greater the loss and the poorer the frequency and phase response, so the poorer the signal fidelity. Delay lines are also sometimes made from discrete inductors and capacitors.

Lower bandwidth Tektronix oscilloscopes use a special differential transmission line whose two conductors are wound in opposite directions in a tight helix. This results in a low velocity factor, for a relatively long delay for a given length. Faster scopes use more conventional transmission lines. Whenever good signal fidelity is required, the transmission line's loss (which is a function of frequency) has to be compensated for. In traditional analog scopes, this was usually done with a series of RC peaking networks connected between the emitters of differential amplifier stages. In the very high speed (5 GHz+ bandwidth) sampling scopes, semi-rigid coax is used for the delay line, and the compensation is done with passive networks. I spent some time at Tektronix designing these.

I've seen just one in the 2kW region - the QEX article mentioned
earlier. Can you give references to any others, please?

>A 2KW power supply Ferrite toroidal core, for example
>(use two at 100KHz) can be purchased in unit quantities from Amidon for

Thanks for the update - I'll look at their web site. Actually, I should
raise the specification, because a SMPS for a 1.5kW output amplifier
needs at least 2.5kW capability, and preferably some reserves above that
for reliability.

>There is nothing magical about switching

Well, I've done all the others, but this one is not the same. A high
power SMPS for a tube PA is a pretty unique combination of high
currents, high voltages and high RFI risk. All the write-ups I've seen
suggest that it's not a simple design job, and that there are lots of
subtleties that only reveal themselves by blowing up expensive
semiconductors. At those power and voltage levels it is definitely not
one to be approached by a "nearly" copying something similar.

I am by no means suggesting it's impossible, and "magical" is not a word
in my engineering vocabulary. But I am saying that if you look into it,
it's not as easy as it seems.

> I do agree with you about FCC B certification. It does not match the

>be a very acceptable solution for many of us.
>
In some cases you could shut the supply off while transmitting, but the
might be problems in achieving a fast enough recovery time for some
modes such as BKIN CW and data modes. And you still have to consider
conducted and radiated interference to other equipment while you are
transmitting. As I said, it isn't as easy as it might seem to equal the
performance of a conventional transformer supply.

> All I am getting at is let's not put certain things in the "magical,
>impossible to do" category, just because they are not yet commonplace in
>homebrew or commercially manufactured ham radio equipment.

"Not yet commonplace" is optimistic. Do you know of *anyone* in amateur
radio who has developed a 2.5kW, 2.5-3kV, 1-1.5A SMPS? Has *anyone* yet
developed and published a practical, modern, reliable design that uses
readily available components, meets good engineering standards and ends
up costing less than a conventional transformer? (The QEX article has
had no noticeable long-term impact, probably because it failed to
qualify on at least two or three of those counts.)

If you can find such a reference, Don, I'll be delighted to try it
instead of the large and expensive lump of iron and copper that I'm
presently thinking of buying!

I agree that it *can* be done, but let's be realistic about it.

Andrew R Mitz wrote:

Believe it or not, you can build an FM receiver with a crystal diode.

Hello--
Good point-- you use a tuned circuit and a diode detector, and tune to one side of the tuned-circuit's frequency-response curve (the process is called "slope detection").

If you're some distance away from the FM transmitter, you may need some audio amplification after the diode detector.

I have a 300W, single 811A class C amp, it uses a 6Y5 as a "clamp" tube. 10-80 meters, non WARC-79. Yes, this NOT a linear but a CW only amp. It was homebrewed by a gentleman who did a exceptional job building it. The only major change I made was to replace the 866 MVR with diodes and set the transformer to a lower tap to compensate for the lower drop. Power supply is a outboard unit connected via RG-8 cable. I have not powered it up in several years but cosmetically it rate a 7-8. There is NO schematic.

I am considering selling the unit but would like to get a general consensus what an item like this would be worth.

Thanks

Hello--

Good recall! See page 385 of the seventh edition-- the circuit uses a diode mixer

and a tunnel diode(!) LO running at half of the signal frequency, followed by
two stages of 200KHz resistance-capacitance amplification (they didn't use
inductors here in Schenectady, podnuh), a limiter and a single-diode detector
(pluse counter type?), and an emitter follower. All done using germanium
transistors, natch<g>.

Just out of curiosity, how is a clamp tube used with a triode? I have
used them with 807, 813, 6146, etc amplifiers to control the screen
voltage in usual clamp-tube fashion, etc.

Maybe in the absence of drive it biased the tube beyond cutoff, but that
is normal for Class C operation anyway.

Just curious . . .

30. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8h7fgbijv1@news.hawaii.edu>
Source record: 60203
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

Rob,
I checked in some of our archive Hitachi data books. While I didn't find the precise part you mentioned, generally Hitachi medium speed SRAM with an LL suffix is low power standby current (spec'ed at 15 uA vs. 50 uA normal). We have used this type of SRAM in various projects over the years and have had no problem with the LL or equivalent version from any manufacturer. (Backup batteries last longer and resetting the SRAM to all zeros by pulling the battery may take a lot longer!)
Most ICs are in very short supply at this point, so you will find problems obtaining many parts at low prices with fast delivery.

The HY628100A is not a Hitachi part but a Hyundai part. Go here for a PDF data sheet.

http://kcs.hei.co.kr/models/sram/sramcomp/1M/HY628100B.PDF

This part only comes in the SOP and TSOP-1 package (according to Hyundai). I'm assuming that your's is in a plastic DIP package? If so you can get a similar part from BG micro for cheep.

Many thanks for the link.

I will use the Hyundi SRAM chip. It is about half the price of most
compatible SRAM chips.

It costs less than $10 US.

Hi Dana,

Thanks for the warning. But it was just pointed out to me that the chip is made by Hyundai not Hitachi.

Details at http://kcs.hei.co.kr/models/sram/sramcomp/1M/HY628100B.PDF

It is a TTL chip. It looks like it will tolerate 5 volts just fine.

For a KPC-3, the LL low low power SRAM chips look great. And they cost a lot less.

Rob

Hi Randy,

I just found out that the chip is a Hyundai chip NOT an Hitachi chip.
Details are at http://kcs.hei.co.kr/models/sram/sramcomp/1M/HY628100B.PDF

You were very close. The standby current in the Hyundai chip is 20 ua. It
should work great with a KPC-3! It also costs a lot less.

There are now many more ways of "publishing" than going through the
magazine mill - web sites being the obvious example.

In the end, of course it's your sovereign decision whether or not to
pass on what you've developed and learned. (Still, I can't help feeling
sad about knowledge that is gained but never passed on...)

I have not thought about a ratio detector at the broadcast
frequency. I also have not seen or heard of the GE
design. See my web page (below) for a discussion of
how the other simple FM detectors work. I would like
to see a reference for either of approaches you describe.

The Phillips TDA7000 and its brothers, which show up in a lot of jogging
FM radios, use a audio or supersonic audio IF.

By far the easiest way to do it is to get a hold of a TCXO out of a cell phone. They all must meet a lot tighter specifications than an AM BCB transmitter does. Most of them are up in the 12 to 19 MHz range so you can simply divide them down to the AM band.

If you want to do it yourself, get an AT cut crystal at about 8 MHz. Take a 74AC00 gate and tie both inputs on one gate together. Tie the input and output of the same gate together with a 1 meg ohm resistor. Put the crystal in parallel with the resistor. Put about 15 pf to ground on the input of the gate. Put roughly 30 pf to ground on the output of the gate. It should oscillate when you put 5 volts on the supply pin of the IC. If it does not try cutting down on the values of the capacitors. You can use the rest of the gate to buffer the signal.

Once it is oscillating you might want to put a capacitor in series with the crystal to put it on to a specific frequency. With our without tuning the oscillator should be plenty stable enough to operate part 15.

Not very elegant, but it should work. Then you divide the output by 8 to get your 1 MHz signal.

Hope this helps.

Colin,

Forget about the TCM3105 chip. They stopped making them YEARS ago. They are IMPOSSIBLE to find.

Instead use the MX614 chip from MX-COM. The MX614 performs the same functions as the TCM3105.

In fact, the MX614 is much better than the TCM3105. The MX614 chip does NOT require critical receive bias or carrier detect threshold alignments as does the TCM3105.

The MX614 packet modem uses a slightly different circuit than the traditional TCM3105 packet modem.

But the MX614 modem works with all BAYCOMM software using your computer's serial port or Poor Man's Packet (PMP) software using your computer's parallel port. In other words, the MX614 packet modem is plug and play compatible with a Baycomm or PMP modem.

The MX614 packet modem was described in January 2000 QST. You can buy a mini kit from Far Circuits consisting of a circuit board, MX614 chip and crystal. See http://www.cl.ais.net/farcir/

The fact that a home VHS deck only has a 2 MHz bandwidth and uses a color under system for the 3.58 MHz chroma signal. Also you only need a vertical sync signal not 15750 horz sync, if you want to modify the servo system there are ways to record the rf with out sync.

Best is airplane ignition cable but it costs.
Poor man's way: wrap each with number 18 stranded 1 turn
per inch and ground all at distributor. Use plastic ties.
No need to ground at plugs.
Reduces S7-8 to S1. YMMV
Also get 12 inch strap from NAPA and ground engine to frame.

From: TC <cadigant2@uofs.edu>
Message-ID: <39398945.3F010D2E@uofs.edu>
Source record: 60152

Art,

I've built a few little 6m transmitters to retrofit some old army gear
(I love those green boxes) with the MC2833, great little chip. Try:

Ocean State Electronics,
www.somerset.net/arm/fm_only.html

Jamco should still have silver mica caps and Far Circuits has the little
circuit board just as you find in the Motorola applications notes... I
just "stuffed" my boards and tuned up - no problem.

Good luck,
Tim Cadigan, WC1F

60. FS New Rockwell International Mechanical Filters

Not all plug wires are created equal!

Check out

http://www.magnecor.com/magnecor1/Index.htm

There are many other ones available specializing minimizing
interference and they aren't the ones available for $10-$20
at your local auto parts store!

Hi Reg,

Why would you want to saw a ferrite rod in half? If you know
anyone with a lapidary saw you can get it done quickly, but,
I repeat, why would you want to do it in the first place?

Tom Donaly KA6RUH

I have a Hamtronics XV4 10 meter to 70 cm TX converter for sale or trade.
Converts 28 MHz to either 432 or 435 MHz on transmit.
10 mW in from 28 MHz gives 1.5 to 2 watts out on UHF.
Good for satellite work or ATV.

See Hamtronics web site for details...
http://www.hamtronics.com/hamtronics.html (look under converters - transmit - XV4)

$65 or swap for a Hamtronics T301 or TA51 220 MHz exciter.
Reply by e-mail

Midland 79-892

Description:

Front panel height and width are 2.5" x 7.375"; width with mike attached on left side and bracket knob on right is 10"; depth with power connector and PL-259 is 11.25"; height with mobile bracket attached is 3.125".

Front panel is divided with 1.75" dia. back-lighted channel 1-40 select knob on right; Left side contains lighted meter upper left with Tone Hi-Lo toggle switch to its right; next is Noise Blanker switch; next is CB PA switch. Across the bottom are, left to right: RF Gain, Vol/PA, Squelch and LSB-USB-AM. Rear panel contains [looking down from top, left to right] SO-239 connector, 1/8" spkr jack, 1/8" pa spkr jack; 13.8 VDC three pin power connector.

Microphone has clarifier control on top of back side where power control is on power mike.

AM power out 4 watts; SSB power out 12 watts; audio power out 3 watts into 8 ohm speaker.

I have two units, each in original box with mike and mobile bracket. Fifty dollars each plus shipping for 8 lbs each in lower 48. These are used but in good working order.

I have seen a machine that does this, it consists of a circular fine blade and a jig that puts very little
pressure on the ferrite, ceramic, or whatever.
You set it up, and let it run for several hours. Very much like waiting for a 5 gallon pot of water to boil from a
candle.
Al

70. Which Rotor?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-03 00:00:00 UTC
From: Roger Halstead <rdhalste@tm.net>
Message-ID: <cq_Z4.13223$LM4.967564@monger.newsread.com>
Source record: 60227

I'm installing a Rohn 45G to 97' with concentric masts, each with its own rotor. The inner mast sets in the rotor in the conventional fashion, although a thrust bearing supports the weight. BTW, I'm using the 4000# Phillistrand guyline at 3 levels..

The next two, which are also supported by thrust bearings, will most likely have to be chain driven. That is dual chain like the primary chain in a motorcycle.

I have one large rotor (One of the old KLMs) that weighs 40# and will certainly handle the torque. Both sides of the top mast clamp come off and I can fit a sprocket to the top of the rotor quite easily as well as to the mast.
I would prefer something a bit smaller though as this thing is big sitting out there on the side. OH! This one will be turning the tri-bander which I hope to replace with a big tribander, although there seem to be few out there now.

I need another rotor to use in the same fashion that will be turning the VHF/UHF array. The problem is that I haven't seen one where I can remove both the top mast clamps. As it only has to turn the VHF/UHF array plus mast which is supported by that thrust bearing it doesn't have to be huge. Mater of fact, I'd be glad to replace the big one with something a little smaller.

These are relatively simple mods, but time consuming even with a machine shop. Even simple projects can be time consuming. It took about $35 worth of metal and close to 10 hours to design (on the fly) a good heavy duty ginpole. (Jinpole?), but it sure works nice.

So, back to the original topic.
IS there, or are there, rotors out there (Possibly several of the Yaesu models) that will lend themselves to this type of conversion?

Any suggestions? and ...No I don't want to turn the entire tower...For one thing I'm already to 40 feet and will be going to 70 via the ginpole with a crane lifting the last 30 feet...While he's here he gets to take down the old 90 foot much smaller steel tower.

60's - 70's Mobile Tel Serv "Phones"

i'm unsure if reaching out to this group is the
right place, but i'm interested in locating one
of those ancient type moblie car "phones" ala
"mannix" or the "honey west" show.

i've been told they were really a radio connect
system into an operator patch to the phone
land lines.

where could i find one of these ? i've looked
on ebay but i really don't even know what one
might be called.

secondly, would it be possible to operate this
type of system now ?

any help to this nutty question appreciated.

thank you.

A private chat room with a ham, now that is exciting.
More exciting than talking to the finast woman in the world.

Please visit my World Wide Web Site, you have never seen a page like it. You
will see:

1. Access to oldies mp3 (albeit on an irregular basis)
2. Really interesting answering machine messages
3. A blond naked chic being held by a female ham!.
4. A guide to the best ham pages ever.
5. Hear Ted Kennedy really screw up in front of Clinton
6. Actually sounds of Bill Clinton "after the lov'in".
7. The writings of me and others on ham radio, hear a typical ham contact.
8. The warm side of K1OIK, hear me speak, see me with famous people.
9. An amazing card game that will shock others
10. Pictures of me and my family.
11. Did common German's enable the holocaust?
12. See now the future of ham radio.

Don't need to saw it. The simple answer is to use a small triangular file to make a small notch at the point where you want the break and then snap the rod into two parts.

:-)) 5 points. But...

"
A nerd is a technically bright but socially inept person. The classic image of the nerd has been the wild-haired genius kid with thick-lensed glasses surrounded by test tubes and computers. Microsoft's Bill Gates is sometimes considered the walking embodiment of the older, successful nerd. As computer technology becomes less frightening and "nerdish" to larger numbers of people, society seems to be developing a more tolerant, even benevolent view of the nerd.

Nerd is a more general term than geek (which always means computer geek) and weenie and is somewhat comparable to propellor head.

Although the term's origin is obscure, one theory is that it derives from a children's book by Dr. Suess, If I Ran the Zoo, in which this passage is found:

And then, just to show them,
I'll sail to Ka-Troo
And bring back an it-kutch,
A preep, and a proo,
A nerkle, a nerd,
And a seersucker, too!"
Dr. Suess's picture of the nerd looks much like the way computer nerds are portrayed today.

I have a MECA Electronics model 700 Dual Directional Coupler with -50dB incident and -40 dB reflected outputs. It has all N connectors. What circuit should I use at incident and reflected outputs for a detector so that I can measure SWR for tuning antennas and such for 440 Mhz? Thanks for any advice.

If you can file the notch in the first place (some grades of ferrite are too hard) then you can generally get a fairly clean break, but nothing like as reliably as you can with glass.

Breaking a long rod in two isn't difficult. Hold the rod horizontal in both hands, with the notch facing *away* from you and your thumbs at each side of the notch. Then break the rod *away* from you - you're trying to make it pull apart, starting at the notch.

This gets much harder to do if you only want to remove a short length. Try holding the part you want to keep in the vice, and hit the unwanted end sharply with a hammer at the side where the notch is. Be warned that there's a high risk of smashing the ferrite, even the part that's in teh vice.

These amateur techniques can work, but there's really no substitute for a diamond saw... or finding ferrite of the right size in the first place... or adapting your design ideas to make it "right" for the size you have.

Tom asked,
> Why would you want to saw a ferrite rod in half?
==========
20 years back or more, following an impulse, I was constructing a transistor, 50-watt, push-pull PA, attache-case portable of my own design, for 160m. In those days PA transistors could not cope with higher frequencies.

Temporary workshop in a corner of the bedroom. Vice clamped on edge of wooden shelf, etc.

I had to wind a tuned push-pull output transformer and some coils for a Z-match/low-pass filter. Looking in the junk box under the bed all I had in the way of ferrite cores were three or four 6" long ferrite rods, 3/8" diameter. But I need cores only 2" long. And I havn't the foggiest idea where I can obtain such cores of the right material. And I need them now - not in 3 months time.

Sitting on the bed, feeling very depressed, it came to me in a flash. Where's my hacksaw . . . . . ?

Several hours later I had a good hacksaw, several ruined saw blades, a few pieces of ferrite rod of various lengths with dangerous jagged ends, and ferrite fragments, sharp as razor blades, all over the bedroom floor. But the depression had lifted

If you don't find yourself in similar situations at least once a year then you cannot truthfully call yourself a radio amateur.

PS. Wind the coils with 18g or 16g magnet wire. Solder into the circuit. Adjust tuning by sliding the core in and out before daubing with fast-setting glue or polystyrene cement. Or buy a Japanese black box.

One truly loves in proportion to the frustration and effort which has been invested - not in proportion to what might be extracted..

> Glen G8MWR
==========
Glen,

The type of ferrite material probably has a lot to do with it. There are many sorts. I have only ever tried to shape the HF variety which has relatively low permeability of 100-200. Drop a rod on a concrete floor and it shatters like glass.

My samples are diamond hard and very strong. After cutting with file or saw some sort of circumferential notch in a rod it still requres a very heavy hammer blow to break it while held in a vice. I have never achieved a clean break which follows the notch. But appearances don't have any effect on circuit operation.

Just had an idea - wonder if it would work if done under water ? ;o)

Yours, Reg.

Never any problems when there's a whole manufacturing facility,
machine shop, etc, at one's disposal.

But 99 percent of DIY homebrewers have no more than a 3/8ths electric
drill, a saw, a vice and a soldering iron. And the iron's no good
because there's no solder, its Saturday night, and the shop is 3 miles
away and doesn't open till 9am on Tuesday morning because Monday is a
national holiday.

100. ARRL June VHF Contest

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-04 00:00:00 UTC
From: Jim <unique1@epix.net>
Message-ID: <393AA15B.44462726@epix.net>
Source record: 60173
Cross-posted to: rec.ham-radio,rec.ham-radio.misc,rec.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.misc

New Hams, you can help too!!!!!!!! Read on!

The Murgas ARC will once again be operational for the ARRL June VHF contest. We are at the confluence of Luzerne, Columbia, and Sullivan counties in Northeast Pennsylvania(FN11uh.) We will work you, just yell! The contest runs from 2PM Sat June 10 through 11PM Sunday June 11(eastern.) We will be running 6m, 2m, 222, and 432/440. All modes.

FM- 2m FM will be done hourly starting on 146.49 and moving to the other standard freq's. This will begin a couple hours after the test starts. FM will be left on continuously on the other bands, however the ops sometimes do not pay attention as well as they should.

If you work us on one band please ask for a schedule for another. All stations are interconnected and you will instantly be met on another band. You may also do this if you are unable to secure an answer from us on FM.

I do not know what everyone has done, but SUBSTANTIAL improvements have been made to the 432 and 440 FM stations. If you have been unable to get a contact in the past now is your chance. We do QSL.

With any HT you can work us from a realistic range. It is not uncommon to work HT's with ducks at a distance of 200 miles! We do have directional antennas, though, so patience may be required. We regularly watch crystal clear TV from the other side of the state.

All you need for an exchange is a callsign and a grid square. If you do not know your square go here: http://www.arrl.org/locate/grid.html

There will be an AIRSHOW at the local airport during contest weekend. If you have an HT a contact would be appreciated.

For the most part advance schedules are not accepted. However if you are seriously interested in doing something unique you may contact me no later than Wednesday evening Jun 7 and I will forward your email to the right person. Send it to jss167@yahoo.com

Our club website: http://www.qsl.net/k3ytl/k3ytl/index.htm

Thanks. All contacts are greatly appreciated.

You mean you don't keep at least one extra 5 pound spool for
emergencies?

I probably have 15 to 20 pounds of solder in my shop, or in the storage
building.

Even if you get it to sync, you'll have a lot of phase jitter in the
playback. If you really want to record a wideband signal look for an
old lab recorder with several MHz bandwidth. They are designed for the
purpose, and I've seen them at auctions, and no one bid on them.
Fairchild division of L3COM.com still makes new ones, I believe. They
are used with telemetry systems to store data during a test, or flight,
and the individual signals can be analyzed later, as needed. Saves on
very expensive Telemetry equipment

Robert Mansfield wrote:

Hello Rob,

Thanks for the info about the TCM3105 and the newer MX614. The problem I have is that I have made a PCB and installed all the other components into the PCB apart from the old TCM3105. I suppose I should have checked the availability of the component before I built the board.

Thanks again and best 73
Colin.

Hi Colin,

I am sure you are not the only Ham who has done exactly what you have
done -- hi

I wish you luck in your search for a TCM3105. You may end up having to buy
a second hand Baycomm modem (already built) or just scraping your project
and building a MX614 modem. (As I mentioned the MX614 modem is actually a
better designed Baycomm type modem).

I understand that Kantronics typically uses the following chips for the KPC
3 SRAM upgrades:

128K
>Hitachi Hm628128LP
>Toshiba TC551001BPL
>
512K
>Cypress CYM 1465LPD

You can check their web site but I believe that KANTRONICS charges $24.95 US
for the 128KB RAM chip upgrade and $59.95 US for the 512 Kb SRAM upgrade.
PLUS $8 US for shipping etc.

In my view, KANTRONICS prices are WAY TOO EXPENSIVE! (Especially if you
consider that the 128 KB SRAM chips typically cost LESS than half as much at
an electronics distributor!! I have not priced the 512KB chip yet but will
do so soon.)

If you find a cheap supplier for the 512KB SRAM chip, please post the name
of the distributor on this Thread.

Thanks

73's
Rob

Hi Ron,

I think you tried to put a text too big. I don't know what is the limit
but they obviously have limit for an entry. Try to break it down to
several small postings and it should work. Hope it helps.

They probably consider that they are not an electronics distributor, and
have to send the chips in single quantities, including an instruction
leaflet. Plus they might have to be available on the phone to answer
questions about the installation.

Electronics distributors may quote single-unit prices, but they are not
prepared to ship single chips all over the country to lots of clueless
persons... Their single-unit prices are for clients that usually take
larger orders that may include a couple of random single units.

Assuming I can get my hands on a VHF voice pager, would it
possible (and feasable) to retune a voice pager to the amateur band? I
would want to tune one to the local RACES repeater and save the
batteries on my HT.

Pete.

I apologize to all of the cowardly Faggots out there who were offended.
Namely, Haertig. I'm also sorry he doesn't know which species he is
and... ha ha.. not even which gender. Boy you must really be mixed goofy
if you don't even know you sex.
As for my name, etc., that is none of your gay-ass business you freak.
What do you think your gonna do if you know my name and address?
Huh. You do NOTHING bitch. NOTHING AT ALL.

Take this ridiculous Chat to private E-mail and not a cross several groups. I think you are all Ignorant Idiots that act like little children and should learn if your going to flame someone for there lifestyle them use E-MAIL not public posting. The rest of use that read these groups do not want to see it at all. If you don't like the original poster for trying to make money on hats with your call sign on them so people know who you are during a hamfest then don't buy it and keep your mouth shut about it. I am for one proud of my call and it makes it easier to display it so people know who I am when they see me at a show or a hamfest. NOW GROW UP AND SHUT UP!!

Voice pagers have no squelch circuit. They unmet upon receiving the
proper tones sequence.
Allan

Rob

I agree that KANTRONICS prices probably also make provision for support.

They may even include some instructions. (But the instructions are already in the KPC3 and KAM manual).

It is not hard. You replace the chip and typically move a jumper.

I can go into the local electronics distributor and buy ONE 128 KB SRAM chip for less than $10 US. They have no problem selling me one chip. In fact I did just that. (The chip was even packaged to be sold as a SINGLE item -- just like many Radio Shack items).

I agree that most electronics distributors probably do NOT want to deal with shipping small orders. It is likely that the shipping and HANDLING costs charged by the local distributor would be as high as the chip alone (e.g. $8 US).

But even if I asked the local distributor to ship me ONE chip, it is likely that the total will be less than what KANTRONICS charges for the chip alone (without the extra shipping charges).

In my view, KANTRONICS prices are outrageous

Judgeing by some of the post's in this thread, several of these
"IDIOTS" need HATS.. To cover the hole in their head where their
Feeble Brain was sucked out.

My opinion of course.!!

I put a post on here a week or so ago looking for a manual for a radio I want to refurbish.

Brad Thompson, AA1IP was one of several that responded. His service was quick, the item was received packed like it was going to go thru a warzone in tact, and was in better that advertized condition. There were NO hidden fees. The quoted price and shipping were exactly what he quoted me.

I would recommend his service to anyone and intend to use him again if the need arises.

138. Equipment Panel Labeling Questions/Advice

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-05 00:00:00 UTC
From: Jim Flanagan <jflan@ieee.org>
Message-ID: <MPG.13a602e3aacc4c069896ec@netnews.worldnet.att.net>
Source record: 60113

Hello..
I am looking for advice on panel labeling. I have seen threads
regarding this topic where the use of decals, thermal labeling devices,
etc. have been used, but I want to learn an easy to do 'paint' technique.

I understand that silkscreening is what is commercially done, but are
there alternative ways that one could do this? As far as silkscreening,
what is the cost of having a stencil made, assuming that I provided the
artwork in negative/positve form? That seems to be where all of the cost

is tied up.. Thanks for all responses...

142. RE Circuit Maker 2000 Schematic capture and PCB layout

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-05 00:00:00 UTC
From: Bob <bmiller@calweb.com>
Message-ID: <393c5a4b$1_2@news3.calweb.com>
Source record: 60117

Hi folks,

Received a big fancy blurb from Circuit Maker 2000 (Protel) this afternoon. Looks like a pretty complete package for 400 dollars with no pin limits and a 32" X 32" 8 layer maximum size. Outputs Gerber files. Their Pro package is about 1k bux and has about twice the number of footprints in their library. I downloaded their PC footprint library discription (5 meg PDF). I noticed that the small pitch package pads are quite asymetrical in size and perhaps a bit skewed given the 0.001 resolution of the overall package. Otherwise it looks ok for casual use and a lot cheaper than an upgrade for my old Orcad SDT II and PCB II combo. I'm real concerned about the very small pitch footprints and how this package deals with them. Has anyone had a chance to try this package.

tnx for the read
Bob, KE6F

One day back at MIT in grad school in the mid-50's, a group of us uncovered a wide-band recorder of the type described below. We connected a short wire antenna to the input and let it run for about 5 minutes.

Then we connected a BC receiver to the output and proceeded to tune around and listen to the various stations that had been recorded.

I have an OLD Collins filter catalog which lists them, but there are several versions of each. There are none ending in 000, however if they end in 00 then they should be 2.7kHz at 3dB long type Y. The catalog I found them in uses kc instead of kHz so you can guess how old it is!

Long type Y are 7/16" dia. and 2 1/2" long not including three solder tabs on each end.

If they don't end in 00 then there are various bandwidths and case styles but I only have data for 011, 021, 031 and 041.

Hope this helps.

149. Collins 30L-1 diode boards available

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-06 00:00:00 UTC
From: Rod Murray <rmurray@mitre.org>
Message-ID: <393D22CD.2A78683C@mitre.org>
Source record: 60122
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.homebrew

Hi folks,

I have reproduced the original diode boards for the Collins 30L-1 amplifier. The boards are high quality copies of the original. All component locations as well as electrical traces are just as they are in the original. I did increase the diode through hole size so the boards can be populated with either 1 amp (i.e. 1N40007) or 3 amp (i.e. 1N5408) type diodes. There are two versions available. One version has a soldermask (dresses up the board a bit), and silkscreen with component reference designators and outlines. The other is just like the original and has neither. Photos of populated, unpopulated, soldermask/silkscreen, bare board and an installed board can be seen at: http://members.aol.com/dw130/diode1.jpg
http://members.aol.com/dw130/diode2.jpg
http://members.aol.com/dw130/diode3.jpg
http://members.aol.com/dw130/diode4.jpg
http://members.aol.com/dw130/diode5.jpg

What I am making available is unpopulated boards in either version. I will include a parts list and source for components or you can use your own choice in components.

I am giving these boards out at my cost to produce of $15.00 each. I am doing this as a service to 30L-1 owners not to make any money from it. (Of course I am not terribly interested in losing money on it either!)

If you would like one or more of these boards, they are available on a first come / first served basis.

Please e-mail me first to confirm availability. Then send $15.00 for each board + $3.55 shipping in the US (no matter how many boards), $6 shipping overseas for one board + $1 for each additional board to:

151. Transistor input and output impedances

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-06 00:00:00 UTC
From: kd4pwb@my-deja.com
Message-ID: <8hjgh6dit1@nnrp1.deja.com>
Source record: 60124

Is there an easy way to get a ball park (or exact) figure on what the input/output impedances are on transistors. Is there a step by step process that I should follow for figuring it out??

Also...what about the same on Power MOSFETS. I'd like to design a complimentary PA for an oscillator that I've got up and running. It's the 74HC240 oscillator. I'm told it can drive a Power MOSFET directly so I'm assuming it's a high impedance output...don't know. The question is primarily for transforming the output impedance of the PA to 50 ohms. I could also transform the impedance with the LP filter too.

Thanks!

Al,

You have completely forgotten that the original US 800 MHz cellular system called AMPS is plain FM with 30 kHz channel spacing. There must be millions of old AMPS phones lying around unused when the 800 MHz systems are migrating towards TDMA.

We have written new firmware for several Scandinavian NMT 450 MHz and 900 MHz cellular phones to help conversion to 70 cm and 23 cm. Most phones from the 80's and early 90's still use conventional 8-bit processors like Hitachi HD6303, Motorola 68HC11, Zilog Z80 etc. and an EPROM for storing the program. Any programmer with some experience in embedded systems can write a simple ham firmware with only the schematic diagram and some datasheets for reference.

See our site for more ideas and references

http://oh3tr.ele.tut.fi/english/modifications.html

And the answer for the original question from George is:

Yes, I already have a Nokia ME59 NMT900 converted for 33 cm waiting
for my next trip to USA :-)

My my, aren't we sensitive. I don't like hats either-with or without call signs-but if someone wants to "where" one, I can't see getting this excited about it. I'm new to amateur radio, but if I meet any more hams as obnoxious as this guy I'll find some other hobby. Time to crawl back under your rotted log, BigUnit, people are laughing at you and you've gotten very tiresome.

Get a decent bench all at once ... and cheap!

Leader LDC-823S 250MHZ Digital Frequency Counter

Data Technology Model 20 Digital Capacitance Meter & VOM in one.

RCA Senior VoltOhmyst VTVM w/probe

I have the original manuals for the Leader (a similar model) and
the RCA Model 20, and a clean copy for the Data Tech.

Asking $155. o.b.o. for all three including shipping conus.

- Thanks! & 73, DavidC K1YP@qsl.net

Wrong nerd. People are laughing at you and your callsign hat as you
gayfully walk through the park. Time for you pull your pants down
and 'get in on' with you special friend.

I am looking for a pair of 7027 tubes. They are used in the Johnson Ranger
II that I just picked up and it is missing one of the modulator tubes.

Thanks for reading,
Bob in Riverside CA

I stand corrected- It could be anything related to the BigScum. From the apparent age of XXX, as indicated by the high tone of the repartee, I had assumed it was younger (by a little). THe vocabulary has not developed much, so I assumed about 6-8 years old, if that.

162. FS: Near mint Icom IC-720A.

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-07 00:00:00 UTC
From: John <john@mm1dsp.freeserve.co.uk>
Message-ID: <8hmd8s$nj8$4@news7.svr.pol.co.uk>
Source record: 60046

IC-720A for sale in near mint condition. Fitted with optional 500Hz CW filter and is complete with Mic, power cable, handbook, circuit diagrams and original box. This small rig (9"wX4"hX10"d) was Icom's flagship rig in its time and will still give modern rigs a run for their money at a fraction of the price. I have a quality digital camera and can send a photo if required. I'm asking £250 to include insured delivery within the UK mainland.

Many thanks.
John (MM1DSP/MM5JLT) Scotland.
G-QRP # 10123.

Hello--

You might try building a one transistor regenerative detector with the pickup coil
connected o the transistor's base. For experimental purposes, try using multiconductor
ribbon cable of N turns, with (N-M) turns in the base winding and M turns in the

collector feedback winding. The number of feedback turns may be from 10 to 25 percent of
the total.

The ribbon cable can be mass-terminated and jumper-wired so that the end of
one turn links the start of the next turn.

Presumably, you're resonating the circuit to 32.768 KHz?

You could also try a TRF receiver arrangement using a ladder filter composed of watch
crystals for selectivity.

You might need an electrostatic shield on the loop winding to minimize capacitively-
coupled noise from nearby AC power lines, PCs, TVs, fluorescent lights, etc.

73,
Brad AA1IP

I've had no problems with my apostrophe ass licker.
Its apparent you have no real argument and have to
reply upon imagined spelling/punctuation errors.
What a dipshit you're.

167. Re: Series LED's

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-07 00:00:00 UTC
From: JW <jdwalton@home.com>
Message-ID: <393F0714.A079C259@home.com>
Source record: 60051

Following upon the suggestions proffered by this group, I daisy-chained a bunch of ultrabrite R, G and B led's, each chain with a series resistor - I can get each of the chains to draw the max continuous current (40ma) for only 7 or 8 LED's (Agilent ultra-brites). This isn't bad as it sure cuts down on the complexity of inter-connects, but I am wondering why I can't go to 10 or 12 LED's in series to draw the same current. When the n'th LED is added, the current in the chain drops from, say 39ma to around 2ma.

I am using a regulated supply (a home brew LM317 type) which will max out at about 30V.

I'm looking for a good solid state all mode 2m xvter.
I've looked the the Ten-Tex 1208 but can't the entire 2m band with it.
Doe's anyone know of one the goes from 20m to 2m.
Kit or used is what I'm interested in.

Thanks and 73's
Chris NG3F

172. Need help with low noise loop antenna input.

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-07 00:00:00 UTC
From: Michael Haseler <news@8SPAMhaseler.net>
Message-ID: <Hho%4.254$z.2709@news6-win.server.ntlworld.com>
Source record: 60137

I'm trying to build a very sensitive loop antenna for detecting the magnetic field from a watch crystal.

I would have no problem with a nice instrumentation amp or a microprocessor, but I'm not familiar with the tricks for RF (well it looks like RF to me!).

I,ve tried looking at the ARRL handbook and Horowitz and Hill, but none of the circuits give the high Q/low noise I need.

I know to achieving my desired 10Hz bandwidth with a tuned capacitor/search coil is not possible, so I need to incorporate some positive feedback to the coil to raise the Q. How do I do this?

Source record: 60139

"Bob" <bmiller@calweb.com>
shared these priceless pearls of wisdom:

. I'm real concerned about
->the very small pitch footprints and how this package deals with them. Has
->anyone had a chance to try this package.

I was one of the beta testers for this new CM2K program and by the time we got to beta-3, I couldn't break the sucker no matter how hard I tried.

Unfortunately, the Traxmaker portion of the new package wasn't ready to try, so I don't have a feel for the footprint problem you describe. I can say that I think the .pdf footprint document you downloaded was probably for the old version of Traxmaker, since I still haven't gotten my first-run copy of the production version of CM2K, and the downloadable "trial" version isn't yet up on their website www.circuitmaker.com

I'll report back here when I get the production package.

179. L.O.S.A - List of Stamp Applications [000607]

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-07 00:00:00 UTC
From: cjX@hth.com
Message-ID: <393e9168.70487353@news.sverige.net>
Source record: 60144
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Hi,

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa/

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 5 years later there are 190+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa/

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may be
dud's. If you previously contributed with one (or more) of the
applications please take a quick look and check your e-mail address

and/or web-links. I'm only able to keep the list updated if I'm
informed about changes, thanks in advance.

1.3 List of contributions

Message-ID: <rice-ya02408000R0806001012210001@news.latrobe.edu.au>
Source record: 60053

Recently, JW <jdwalton@home.com> wrote:

"I am wondering why I can't go to 10 or 12 LED's in series to draw the same current. When the n'th LED is added, the current in the chain drops from, say 39ma to around 2ma".

You have discovered the wonders of Kirchoff's Voltage Law[1], which says (for a series connected string of things) that the sum of the voltages across each thing adds up to equal the supply voltage.
Vs = Vr + Vled + Vled + Vled + Vled + Vled + etc.

Each LED has a more or less constant voltage across it when passing enough current to light it (2 to 50 mA). So, as you add more leds, the voltage available to the resistor becomes less. Eventually I = Vr/R becomes small, no matter how low you make R.

ie: as you have discovered there is a limit to the number of LEDs in a series string... or else you can use a higher supply voltage!

1. Sorry, but Kirchoff's voltage law is derived from conservation of energy & as every good engineer knows:
1. You can't win.
2. You can't even break even.
3. You can't get out of the game.

Source record: 60054

Bill,

A few quick bits and pieces of the puzzle, I've used bipolar transistors but the approach works for tubes or fet's.

1) Manufacturer's data sheets are always a good place to start. Most manufacturers have them on their web sites.

2) Amplifiers tube, transistor, or what ever are generally designed to put as much power into the load and as little into the active device as possible. Think of the power company, they want to burn up as little power in the wires and as much in your home as possible.

3) If you are after 120 watts out and have a 12 volt supply you probably will have to put about 20 amps into the amplifier, maybe a bit less. 20 amps dc works out to 40 amps peak to peak AC = 14 amps RMS. Since E/I = R impedance will be 12/14 = about 0.85 ohms. In reality it will be a bit lower than that by about 20% due to some device issues. That gives about 0.7 ohm.

4) Once you put that load on the transistor you need to find the source circuit that will fully modulate the transistor and be low impedance enough to keep it stable. This is not as easy as the output impedance. Try starting at 10X the output load. In the case above the first input drive impedance to try would be 7 ohms.

5) None of this takes anything about frequency into account. If you are running at a low enough frequency that may be ok. If you get up to higher frequencies you will need to resonate out the input and output capacitance of the device.

6) None of this addresses stability. The normal way to take care of this these days is with CAD programs that are aimed at circuit design. ARRL Circuit Designer is an example of one. The device data you feed into it generally comes from the manufacturer's data sheets. Again, may not be a problem at low enough frequencies, but watch out as frequency goes up.

So much for amplifiers ....

Your HC gate based oscillator will drive a 74ACxxx series logic gate. AC series parts are specified to drive much lower impedance loads that HC parts. One way to go is to simply get a hex inverter (74AC04) and parallel all the gates in it. You should be able to get about 0.1 watt out of the 74AC04 IC without it catching fire. It will give you enough drive voltage to hit a FET pretty well. The problem will be stability as the stage gain gets to high. A watt out of the amp should be ok. 10

watts or more and the amplifier will be hard to tame.

Hope this helps

Well first off, do the math.

You want the entire 2M band? Why?

But ok, you may have a reason... But back to the math. How wide
a coverage at 20M to do 4Mhz wide for 2M?

The only option I see is to make up a switcher for the transverter
offset.

And the easiest way to do that is the HamTronics setup. Although
I don't know if they have a 20M-2M setup. But you can build their
2M transverter (two separate boards) for 10M, and 'connect'
them to use the same offset crystal. Then they sell a little xtal
switcher for up to 4 xtals for other uses, and just use that to feed
the transverter....

I have just acquired a Regency HR-2B as my first radio.
However, all I have is a radio (well, one and a half, for parts).

There are a lot of crystals in it, although I may need different ones
for the local repeater. But, I have no microphone, or documentation.
I need both...

If anyone can provide me with a source of information I would be
very grateful. I *think* the microphone plugs into a phono jack on
the side of the unit, near the front. I could be wrong, but if so the
only other possibility I see is wiring it to the screw terminals in
back?

I am hoping to find a manual, schematic, or some other source of info
as well. Does this model appear in any books? If anyone has
documentation, would you be willing to provide me with a copy?

I'm open to other suggestions, as well.

Thanks...

I own an Alinco DJ-F1T handheld 2m transceiver. Since moving into a high-rise apartment near the centre of a city of 750,000 people I am now suffering intermod problems from pager transmitters, which of course, did not occur in my previous country residence!

Does anyone know of a simple filter to build or purchase, or a mod of some sort, that might help solve my problem. I know of large 4 pole filters on the market but they are not really appropriate for a handheld. Any suggestions would be appreciated.

PAR Electronics makes some excellent filters for precisely this problem.
AES sells them,
www.aesham.com or you might try www.parelectronics.com (not sure about
that website, but their email address is par@parelectronics.com). They
aren't cheap, but are small enough to fit on top of your H/T. I use one on
a mobile VHF radio and it works great.

Hello Ron,
did you have any luck finding a schematic,if not I have a photo copy
here,its about 3 pages,.For a very small fee,mainly to cover postage
and copy cost,I could mail you a copy.
Also,I will be putting an MS-15 up for auction on E-bay that does not
work.It had a trace until someone tried to rejuvinate the crt.I
beleive
the filament is now open in the crt.It would make a great parts unit
I'm sure.I don't have the battery pack or any accessories for it.Just
the scope and cabinet.It will be fairly cheap.If you would be
interested,let me know and I'll E-mail you when it's posted.
Thanks,
Alan

Hello,
Please take a look at the meter I have listed on E-Bay.
If you are homebrewing a big tube RF amp and need to accurately
measure the High Voltage, or if you are building a HI-Pot tester, this
meter is just what you need.

Toko makes little helical bandpass filters for 2m and 70 cms. They are
quite cheap. You could try mounting one of these in a small diecast box
with BNC connectors on it.

since signals on FM are usually quite strong, it is sometimes an
improvement to put an attenuator in the front, you probably don't need
the power, so it could be used for transmit as well

we have 100W RF pagers on 148.050 and 148.100, but the worst problem
wasn't blocking, but transmitter noise spectrum, so the manufacturer
had to modify the power amplifier (better decoupling) to improve on
this

206. Re: Series LED's

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-09 00:00:00 UTC
From: "J. Strupat" <john.strupat@sympatico.ca>
Message-ID: <3P505.42839$dK2.994304@news20.bellglobal.com>
Source record: 60079

Should work but value of the series resistor will be fairly low!

With 10 LEDs at Vf of 2.0 VDC each (check spec.) at 40 mA, the series total voltage for all the LEDs is 20 VDC.
With your supply at 30 VDC the series R required for the whole chain is (30-20)/0.04 = 250 ohms

Unless the forward voltage drop across each LED is something like 3 VDC, you should be able to make a series chain work. A combination of parallel strings of series LEDs , each with 1 dropping resistor will be needed if you wanted lots and lots of LEDs.

BTW What do you call a burnt out LED?

DED! Dark Emitting Diode.

Hello, I'm looking for a set of crystals that will fit a Regency
HR-2B.

The local repeater is at 147.135 + , I believe that means I need one
at 147.135 and one at 147.735.

If anyone is looking for other 2 meter crystals, I now have some I
might be willing to part with.

Any help will be greatly appreciated, I'm a brand new ham and this is
my first try at finding parts...

Thanks!

FS: For Heath SB104/A mixer upgrades, or for anyone building mixers, modulators, etc.:

MATCHED QUADS: (i.e. four discrete, long-leaded) hot-carrier diodes. They're Hewlett-Packard's p/n 5082-2805 and according to HP's RF catalog are 1N5711s matched to within 20 mV of forward voltage drop at a forward current of 5.5 mA. Supplied in factory-sealed antistatic packages with 1996 date codes.

Price: $3.00 per quad, or four quads for $10.00, or 10 quads for $20.00.

****
Also available:
****
INDIVIDUAL (i.e., unmatched) 1N5711 Schottky diodes: full-length leads, taped and reeled, $1.00 for 10 pieces.

****
MMICs! Hewlett-Packard DC-2 GHz, 12.5 dB gain, 4-volt powered MSA-0786s. Supplied in antistatic-taped factory packaging; leads configured for surface-mounted applications.

Price: $1.00 each, $5.00 for 6, $10.00 for 15, or $25.00 for 50 pieces, or $40.00 for 100 pieces.

****
* NOS Warranty policy *
****

If you purchase NOS components and find them unsatisfactory upon your inspection, you can return items in as-received condition for a full refund or replacement (if available) within 30 days.

This material is subject to prior sale and is supplied as-is, as new-old-stock (NOS) merchandise, with all responsibility for safe and successful application residing solely with the purchaser.

****
* Shipping per order: *
****

Please add $4.00 for priority-mail postage within the U.S.

Overseas buyers: inquire for postage.

Please make your check or money order payable in U.S. dollars
to Brad Thompson.

Source record: 60087

Usually anything under 50 mhz is referred to as the DC bands. AS DC may be thought of as '0' Hz to hams operating 50 mhz and above think the frequency of any thing below that to be DC. Just a nickname, such as the 'top band' is usually thought of as the 160 meter band as it is the highest number of meters for the ham bands in many countries (US anyway).

Message-ID: <394133a6$0$795@reader5>
Source record: 60088

Hi group,

For more than 15 years my FB33 3el. triband yagi is doing a great job.
I bought the beam from another ham and he was missing the installation documents.
For 20m , the SWR is poor. It's peaked in the upper part of the band. Due to the lack of docs
I'm not able to tune the beam for the lower 20m band part.

Can anyone mail me a copy (scanned version) of his documentation.

Thanks in advance,

72/3, Carel

216. Heath IP27

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-10 00:00:00 UTC
From: JW <jdwalton@home.com>
Message-ID: <39427C6A.2FD6DF63@home.com>
Source record: 59995

My Serial LED question now has me fixing up a "blown" Heath IP27 - the zeners were shot, one of the series transistors tested bad etc., rectifier diodes were really inefficient etc. Transformer was fine, cosmetics were surprisingly good. (Actually, I have two of these picked up on EBay dirt cheap - used test equipment no longer goes to Heaven.)

This PS has a multitapped transformer so one can derive voltages in 5V increments from 0 to 50V. I was wondering the following:

1) Using a LM317HV, why not bias this regulator from -1.2V to +43.8V in 5V increments. The IP27 has a three deck switch and it could be pressed into service as a voltage divider driven by a zener. (Neat that the IP27 has the capability of deriving this bias voltage.)

2) I've installed an LM337L to generate -1.26 volts - cheaper than a 1.2 volt reference diode. That's where I get the bias below ground potential.

3) Should I bother providing the LM317HV with a series pass transistor (as in the handbook - the PNP/NPN configuration) - needs minimum 30ma draw to work effectively. I have the stuff to do it, but is it worth the bother.

The Frederick Amateur Radio Club (FARC) presents the annual
Father's Day Hamfest on Sunday, June 18, 2000
from 8:00am to 3:00pm, rain or shine.
(Access for tailgaters opens at 6:00am)

It's at the Frederick County Fairgrounds on East Patrick Street in
historic Frederick, Maryland. Easy access from I-70 and I-270,
plenty of parking.

Talk-in on the 147.060(+) MADRA repeater.

We'll have Radios, Electronics, Computers, Acres of Tailgating,
Indoor Commercial Vendors, VE Testing and more.

Good food and refreshments available.

On the web go to http://www.qsl.net/k3erm/ for more info and a map.

General admission is a $5.00 donation.
Tailgating spaces are $5.00 each + general admission
Indoor tables are $10.00 each before June 10th, $15.00 after.

One of the largest and most popular hamfests in the
Baltimore/Washington metro area. Don't miss it!

Questions? E-mail k3erm@qsl.net or direct to me

Thanks & 73,
Bob K9CMR

The RCA TK41 studio camera used Nuvistor preamps in the
camera head. The Ampex VR2000 videotape recorder used
Nuvistors as head preamps. Several professional microphone
preamps also used Nuvistors. Some UHF tuners used Nuvistors.
They provided a lower NF than most other tubes of the era, ie
better than a 6AF4, and had a better gain bandwidth product too.
(The WE416B was better, but very expensive.)

No, disc planar tubes were developed for use in artillery shells (for proximity fuses). Their construction allowed them to withstand the rather incredible G forces caused by the shell's spin (about 200,000 RPM). Conventional tube elements would be grossly distorted by that, and the tube would fail. While rockets generally don't provide that sort of G force, this type of tube was also used in early rockets because it was so rugged (for a tube). These are not Nuvistors, though some planar triodes are about the same size as Nuvistors.

However, GE did develop a "tube" specifically for use in satellites. I put tube in quotes because it was really a collection of tube elements forming a vacuum tube equivalent of an integrated circuit. These were called TIMs (Thermally Integrated Modules). The entire structure was heated to provide emission rather than having individual heaters for each cathode. (There were proposals to heat the TIM with a solar mirror on the satellite, though I don't think any satellite actually did that.) A big advantage of the TIM was that it was rad hard, unlike solid state components, and it was faster than the solid state components of the era. Logic elements were produced in TIM form that were virtually immune to the radiation flux in the Van Allen Belts (they also worked inside nuclear reactors). RCA's Silicon on Saphire technology killed the TIM for satellites because it was smaller, and required much less power, a very limited commodity on satellites. Nuvistors weren't TIMs either, though again the sizes were comparable.

Nuvistors were just small metal envelope triodes with a good NF and a good gain bandwidth product. They were used mostly as preamps in equipment requiring these characteristics, ie camera heads, videotape heads, UHF tuners, etc. The most common Nuvistor was the 6CW4.

The first place I saw these tubes was in military manpack radios. They
were smaller than subminiature tubes (the 12AT7, 6AF4, etc are examples
of subminiature tubes, and these tubes were about 1/8th as large as those).
These tinier tubes operated off of relatively low voltage too, 12 to 24 volts
on the plate was commonly used. Some designs used even lower voltages.

Howdy J......You guessed correctly - DC referring to low frequency, once again showing (our) amateur flavor. At one time, when many amateurs tinkered and felt (or were) quite competent about radio, it seemed that coining slang was part of the fun, like foolish and ineffective (not intended to be) phonetic's. It has backfired on us all, of course, as many now take a lot of this slang to heart and (we) often sound like what we dreaded..........

Hi,

I have a Ramsey Electronice CT-50 Frequency Counter. I understand that there used to be a kit to add onto this frequency counter to make it a digital display for an older HF rig (I have a Kenwood TS-520).

Does anyone have the plans for this kit, the schematic, or any information about how to obtain this? Ramsey Electronics verified that there used to be a kit, but said they don't know how to obtain the plans now.

Thanks for your help.

Our FD had used the Motorola Minitor II pagers for quite sometime. They were crystak controlled, and had a set squelch on one position, and tome activation on another position. Also, these can be setup for 2 seperate freqs, but do not scan, they need to be manually selected. As I recall, when we got rid of them a Ham club got a few, and changed them over. You would need to change the crystal, and retune the reciever. If you would want a tone activation, you would need the appropiate tone reeds, and a unit capable of transmitting the tone. Hope this helps...

Try searching some of the balloon sites. Some of these guys have the
same requirements (low weight, small size, etc.), plus the additional
requirement that the transmitter be capable of operating for days or
weeks since the distance traveled by a balloon carried transmitter can
be hundreds of miles. One beginning approach is at:

http://fly.hiwaay.net/~bbrown/circuits.htm

although it needs an ID-er, and I'm a little afraid of the harmonic output.

Dave

Greetings,

I'm trying to locate details on an ancient gadget called a "polaplexer." It was basically a 10cm transceiver using a 2K21 klystron tube, a surplus radar diode, and a 1/2 quart beer can. Does anyone remember where this device was described? I seem to remember it being in QST, but have not been able to find it. It would have been sometime around 1954-1957.

The klystron was operated in it's two different modes for transmit and receive. These were about 30Mhz apart, so a receiver that could tune 30Mhz became the IF amplifier.

Source record: 60008

Hello Andrew,

Welcome to the fun. I've been in the hobby for about 8 months now and like you I was a long time wannabe. I have built a 75watt transmitter (80/40 meters) and a good HF receiver. I've spent a total of less than $100 for both. The transmitter I built is tube based and is described in the 1967 ARRL Amateur Handbook (The Inexpensive 75-Watter). The receiver is also tube based and I also got the design out of an old copy of the Handbook (The Junior Miser's Dream). I also built the Mate to the Mighty Midget which is described in a 1966 article in QST. Both receivers are ok but they are not as good as I'd like so I'm presently building the HBR receiver. If your interested you can go here.

http://www.inetport.com/~talen/

The total cost of this radio is going to be about $200. My first receiver was a regeny that cost me $1. Fifty cents for the old radio that I scrounged the parts from and fifty cents for the Goodwill cake pan that I mounted it to. I made the coils by hand from some wire I had lying around and wrapped them on some old discarded PVC tubing.

If tubes interest you you can go here for a start

http://www.qsl.net/n6ev/Glowbug.html

If you do not have a current handbook, get one. If you are interested in tube based designs, go to your local library and check out the older copies. I'm lucky, I live in a town that is blessed with the state engineering collage. Not only do they have a lot of books on the subject but they also have decades of back issues of QST and other Ham/Radio related magazines.

For web sources go here.

http://www.geocities.com/CapeCanaveral/Hall/8701/hamfiles.htm

Bry's got the best page for links to homebrew sites.

This guy has got a lot of inexpensive qrp projects. He also has a lot of good information of antennas.

http://hem.passagen.se/sm0vpo/

I built his 5 watt qrp from junk parts I had lying around, it works pretty good. You would be surprised at how far such a radio can reach on a good night. That link is here.

http://hem.passagen.se/sm0vpo/tx/5watttx.htm

It sounds like you've got a good set up to work in, I've got one small corner in a small bedroom in a small apartment (bitch moan, bitch moan). When your ready to

start building some thing you can try these places to get parts.

http://www.alltronics.com/
http://www.tubesandmore.com/
http://www.oselectronics.com/
http://www.fairradio.com/

What I can't get for a few dollars at second hand shops I can usually get from one of these guys

I build all tube gear for a good reason, I can almost always pick up a old TV or radio for a few dollars or free (it also helps that I've been scrounging for about 25 years). I also am completely amazed by tubes, they light up my room and keep my coffee warm.

For a lot of good help, post problems to this NG. Without these guys I wouldn't have working equipment. I kept a few of these guys occupied for several months when I was building my gear. Their help and advice went into almost every part of my project. Thanks guys! But also, DO go to a local club. You'll find that any number of their members would be glad to be an Elmer. They can also set you up with old scrounged parts and equipment to get you started. It's very likely that one of them would have an old receiver laying around that you could barrow till you can build/afford one of your own.

At this point the best thing for you is to do something, anything. Find a simple schematic on a web page or a magazine. Maybe a simple regeny receiver or a simple QRP transmitter and build it. The thrill you get from hearing your tone on a receiver from a transmitter that you built or hearing a station on a receiver you built is priceless.

Good luck!

Rick KC0GIX

It should be noted that they were used in television sets all the way
through the sixties and a bit into the seventies.

At least third edition of "The Radio Amateur's VHF manual" (1972)
contains one page about the Polaplexer made by the San Bernardino
Microwave Society.

The article is referring to the following QST articles for the 3300
MHz band:

Baird: "Radio Club for Microwave Enthusiasts" Dec 1957.
Bredon: "Let's Go Microwave" Jun 1958.
Peterson: "Practical Gear for Amateur Microwave Communication" Jun
1963.

I haven't seen these articles, so I don't know which one contains the
relevant information.

Bob, you may find 813 specs to show about anything,, I always use Orr handbook specs. they show 2500V plate at max sig plate cur of 200 ma. I have seen them run at 4000 Volts (not very long).. many people abused them big time ,probably because they were at one time very cheap ..I have also seen three tubes running at 3000 Volts give 1500 watts out..it is really a great tube ..enjoy .. I have been handed an IC735 which has been dropped a foot or so and now is
stuck on transmit
I've checked out the tx/rx switch and the relays but these appear OK. One
thing I have noted
is that the heat sink (piece of aluminium sheet) attached to the AF output
device and an IC gets very
hot as soon as the rig is turned on, I turned the rig off asap.

Has anyone any clues so that I can return the rig to health pls?????//

Tripplite Model SB-1000 units with regulated battery charging and transparent auto-changeover to and from AC power. Rated 1000 watts continuous output. Use 12 volt DC plant. Great for UPS at repeater site, etc. Manual included. At least 10 years old but never used. Tested good. $150 each + shipping or pickup in Van Nuys, CA area. See photos at www.hightechspecialties.com . Respond email: toomuchstuff@pobox.com thx,Jon

Nothing wrong with my writing skills. Maybe it has something
to do with your reading skills.
You don't know what color I am but thanks for the advise
on how to make friends.

it is also shown a 10GHz poilaplexer transceiver construction emplying
723A/B klystron in RSGB VHF manual (third edition(-1978) pp8.34/8.35,
picture and mechanical construction is shown, also pp8.10/8.11
construction for 9cm band with formula and mechanical construction,
power supply, AFC, modulator etc

never thought of it as relevant construction, but believe my friends
GW3PPF and GW4AMV tried something similar for 10GHz - back in 1973, as
Steve mentioned in the office in Cardiff

Unfortunately GW4AMV is silent key, and some rumours claimed that it
was difficult to reach GW3PPF - even on telephone.....

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

I was fortunante enough to have an electronics teacher that tought
tube theory (N3NAN), but that was a while ago.

I recently acquired a working Lloyd's AM/FM BCB radio for $3 at a
garage sale while visiting Pittsburgh, with 7 tubes (Model TM-821-A,
with the following tubes: 2 12DT8, 2 12BA6, 12BE6, 12AV6, and a
50C5). The radio works beautifully (gotta love that sound), but
needs a little work on the tuner mechanism, and the volume knob is
*slightly* touchy. I love listening to it (even music I don't like).

Problem is, I love to tinker (don't we all in this group?). I was
wondering if anyone could point me to a place to start, to re-learn
about tubes, and if anyone has any useful suggestions if something
like a 6m CW Xcvr, or a 40m CW Xcvr could be made from these. I have
a RS SW radio, but the bandwidth is crappy, so if all else fails, I
could just build the Xmtr for the above 40m (or 20, 15m). I'm not
looking for a lot of power (I currently have a 3 transistor 1.5w 80m
CW Xmtr), and, actually, less than 5w is preferable for this. I have
basic equipment (resistors, soldering iron, DMM, magnet wire for
winding coils, etc.). Or maybe even an idea for a 10m beacon with
these parts?

I'd appreciate any help. I don't ahve a lot of money (so can't go
buying a lot of stuff), which may also explain my interest in
homebrewing :) I'd prefer a VFO type Xcvr/Xmtr, as I don't have many
Xtals in ham bands.

Look on some places like ebay.com for some ARRL Handbooks that date from about 1966 back. Lots of tube stuff in them. You may find some ham that will give you an old one if they have them.. Seems that they change very little from one year to the next. I usually get one every 4 to 5 years.

>
> ps: part # um9503 this thing is a stud-mount 10/32 or there abouts.
>

Hello--
My 1975 Unitrode manual lists a UM93xx series (CATV attenuator PIN diodes)
and a UM94xx series (Two-way radio antenna switches) but no UM95xx devices.
From a still earlier (1971) catalog: the part numbers are structured as follows:

Example of a typical part number:

UM 4904 C

where UM = PIN diode; 94xx = series 4900 yy04 = 400 volts breakdown voltage
(speced at
10 microamperes reverse current) in hundreds of volts; C = package style.

Thus, your UM9503 would be a series 9500 device with 300-volt breakdown.

Sorry i don't have the exact specs, but I hope this helps.

73,
Brad AA1IP

252. ANTENNA QUESTION / help !

OK....for starts please send your reply directly to me at VE7LWB@rac.ca
and
" NOT " to the address of NO_SPAM@NO.SPAM.com

Here is the question. Lets say I have two 4 element yagis, and lets say
that each
give a gain of 10 dbd on UHF. Now if I co-phase them the gain will not be
20 dbd
that much I know all to well, but how much extra gain will the second
antenna give
to the one that is there. I am not sure, but something tells me the gain
increase
would be in the order of 2db making the two 4 element yagis give me 12 dbd.
I THINK ???

Can someone give me a clear ansewer to this question?

Also, if I would use 4 of them all co-phased, would the db gain go in
steps or would
it what ??????

And last part of this question. How many antennas could I co-phase
together
before the law of deminishing returns would step into play here.

And please don't tell me it's in the ARRL handbook. I already looked and
can
not find what I need, so don't even go there.

Please reply directly to me at VE7LWB@rac.ca Thanks......

.

The gain would increase by 3 db, so you were close. If you put up a second pair for a total of four, the second pair would give you an additional 3 db for a total of 6 db over the single. The next three db would cost you four more, etc.

It's obselete. You might be able to get the datasheet on the Mitel
web site (where I got one for the ZN426 or 428 DAC). As I remember
it, it's http://www.mitelsemi.com and you take the link for "Site Map"
and then "Services" and that gets you to a search page for their
obselete datasheet library that they inherited from GEC Plessy who
took over Ferranti.

If this it the low pin count TRF receiver chip, I remember a posting
that some asian company made it under the some MK number (MK484?).
Try the Hong Kong based "Kits R Us" company's web site, I think
Peter Crowcroft said he sold it.

> >
> >Dave

The USB one is 526-9193-00

My list shows USB (Z-4) in 4 kHz steps from 60 to 104 kHz, and LSB in two series from 64 to 108 but one set (Z-7) is 2.9kHz wide and the other (Z-8A) 2.4 kHz.
All are the same size (case L).
However, each set uses a differing dB reference level so a true comparison is difficult unless you can get hold of the complete spec sheet - I just have the General Catalog with basic specs for the complete line.

Dave

An old issue of the ARRL Handbook had a set of single band amps using a pair of 813s running the legal limit as I recall.

I built up a pair using a B & W PI network and ran a full KW average input (before they changed the rules) input grounded grid by tying the screen and grid together. This was back in the 60s somewhere.

I wound the filament choke on a pair of ferrite rods, but don't remember much else...The input was untuned.

I would suggest getting a service manual or, at the very least, a schematic diagram in order to troubleshoot that unit. I am experienced and would certainly insist on such information, especially since it's readily available.

If you want, I can fix that radio for you.

263. using a regenerative receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-13 00:00:00 UTC
From: "sb1963_bis@yahoo.com" <sb1963_bis@yahoo.com>
Message-ID: <394608C5.20BAC91C@yahoo.com>
Source record: 60033

I need some help with clear, step-by-step instructions on how to use a regenerative shortwave receiver like the TenTec 1253.

I heard somewhere that the best way to pick-up weak signals on a regen. receiver is to:
1.- start by increasing the regen control until the radio begins to oscillate
2.- back-off the regen control a little to stop the oscillation
3.- tune to the station
4.- adjust the regen and volume controls to achieve best audio

Is this the best way/procedure to tune/find stations? How do I use the RF gain control of the 1253? Should I start scanning with the RF gain set high or low?

I will appreciate any help to develop simple, step-by-step instructions on how to best use my tk1253 receiver.

Thanks.

Simple, two 10 DB antennas cophased will give you an overall gain of 13 DB. Four 10 DB antennas cophased will give you an overall gain of 16 DB. Eight 10 DB antennas cophased will give you an overll gain of 19 DB. Basically everytime you double the amount of antennas your gain goes up by 3 DB - theoretically anyway. However each time you are putting a splitter (for more antennas) into the feedline you are increasing the loss factor. There is no set limit to the amount of gain that you will be able to achieve but I have not seen to many go past 16 beams - the EME crowd do go for more but the amount of money it would cost makes it prohibitive for most of us to do this. For 2M and 70cm most people don't normally go for more than 4 beams - indeed most will stick at one or maybe two. Hope this helps you out.

Cheers

Matt

I second the the idea of finding or buying a old ARRL Handbook, pretty much anything before the mid 1970's. William Orr books were also very good. Also look around Estate Sales, used book stores, flea markets, garage sales, etc. for OLD electronics training books. I have a wonderful one from the late 1950's that even uses a Navy RBA receiver as an example. Also, also trying applying FET and MOSFET ideas to tubes. Also though not completely true, the joke "a tube is an high voltage FET with a heater" is is not that far off from the truth in functionality.

Best of luck and 73's

>amplifier.
>

I remember a technique referred to as "rocklock" which ran a single 10 GHz source. It used two frequencies 30 MHz apart so the LO was also the transmitter. The IF was 30 MHz and maintained on that frequency by an AFC loop. One transceiver was the master and the other slaved to it for frequency control purposes.

I remember an article on this subject in QST in the early 1970's. One of the authors was Dick Kolbly, K6HIJ who happened to be a friend of mine.

The term polaplexer derives from the use of orthogonal polarizations for isolation of the receive and transmit signals. It was usually accomplished by launching two linearly polarized waves in a circular waveguide and feed. It did this with two linear probes mounted 90 degrees apart on the waveguide wall.

I hope this helps you narrow down your search.

3dB is double the power. In general, if you double your antenna system,
you approximately double your gain so two properly phased 10 dBd antennas
yield about 13 dBd gain.

There are a lot of web sites now with new vacuum tube projects.
I you don't find them, ask at rec.antiques.radio+phono . These
guys live and breath vacuum tube radios. The group is for
broadcast band stuff, but that is a good place to start building.

The procedure you describe below is correct, unless you want to receive SSB
or CW transmissions. For that you need the oscillation. Leave the RF gain
high unless you need to back it off for a very strong signal.

Source record: 60043

Dean Arthur <dearthur@silverstar.com> writes:

CB-band to 10M band....I was pleasantly surprised at how simple it can be.
I was especially interested in SSB for 10M since my son just got his
Tech-Plus license and can operate on 28.300 MHz to 28.500 MHz SSB (apparently
AM is illegal). His "wife's budget" only permitted something "cheap".
I bought a couple of "working" SSB CB's for $20 each at a recent Hamfest...
Midland model 79-892, and a Cobra 138. The Midland uses a PLL-02A phase-
locked loop synthesizer to control the 40 channels, and the older Cobra uses
10 quartz crystal oscillators to control its 23 channels.
I suspect there are dozens of other brands that have almost identical design.
I remember converting a 23-chan Kraco (AM) many years ago which used a PLL.
I was fortunate enough to get service-info (SAMS PHOTOFACTS) thru our local
library....CB-180 (April 78) for the Midland, and CB-57 (Sept 74) for the
Cobra.It's a good feeling in our throw-away society, to be able to re-cycle some
of this great equipment of yester-year.
Converting the Midland is quite simple..its PLL has nine control lines
capable of divide-by-n (1 to 512). The Midland only needs to divide by 255 thru
211 for Chan-1 thru Chan-40 respectively, so that the 256 line (pin 7) is
disabled permanently (grounded). Since a division of at least 211 is needed,
the 128 and 64 lines are always enabled (tied to +5), and the remaining six
lines (pins 10 thru 15) are switched by the Channel Selector dial to progress-
ively lower the count from 255 thru 211.
These values may only apply to this model, or perhaps other Midland models....
they depend on choice of VFO and I.F. frequencies, and the down-shifted fre-
quencie offered to the PLL, which always divides-by-n to reach 10 KHz which
provides phase-locked-loop control, to force the VFO to move in 10 KHz steps.
In this particular model for example, on Chan-30 the VFO runs at 38.000 MHz
mixed with an I.F. frequency of 10.695 MHz to provide the Chan 30 frequency of
27.305 MHz. (This is a good example because for converting to the Novice band,
we will want to start at exactly 1 MHz higher...at 28.305 MHz). In addition,
to down-shift the VFO for manageable frequencies for the PLL, it mixes it with
a fixed 40.210 MHz for a difference of 2.210 MHz (on chan 30). Dividing this
down to 10 KHz requires a divide-by-n of 221....of which div-by-192 is perm-
anently wired as described above (pin 7 LO, pins 8 & 9 HI), so that only an
additional div-by-29 is needed and the Channel selector knob supplys this (on
chan 30) by grounding pins 10 and 14, and enabling (to +5) pins 11, 12,13 and
15. Pins 7 thru 15 represent div-by: 256, 128, 64, 32, 16, 8, 4, 2 and 1, res-
pectively.
As a side note, many people do not realize that below Chan 20, there are
five places that adjacent Channels actually jump 20 KHz, instead of 10KHz:
...i.e. between 3 & 4, 7 & 8, 11 & 12, 15 & 16, 19 & 20 ....all are separ-
ated by 20 kHz. The remaining channels thru Chan 40 all have 10KHz separation.
I hope all this expanded theory will be helpful in analyzing some of the

various models on the market.
GETTING BACK TO HOW SIMPLE IT WAS TO MODIFY MY Midland 79-892, all I had to do was cut the PC-board foil to pin 8, then connect pin 8 to pin 7 (which was already grounded). Then tweak the slug on the VFO counter-clockwise to raise its frequency to 39.000MHz which raises the operating frequency to 28.305 MHz as mentioned above....but if you are expecting to receive or transmit on 28.305 MHz, the Chan selector needs to be on Chan-6. The VFO can is the largest shielded-can about 5/8" x 1 1/8"...much larger than any others...with the ferrite slug on top. Operation will not "pop in" until you tweak the VFO near enough for the dc control voltage to capture contol of the VFO. Until then, an out-of-lock signal will disable the system. You can measure the dc control voltage coming out of the PLL (IC-1, pin 5), and tweak the VFO until this control-voltage centers at about 3.5v on Chan-12 (about the middle of the Novice band) although it's not critical. If you plan to operate higher than 28.500 MHz, you might want to center it on a higher channel.
To summarize the theory of this example on the low end of the Novice band: VFO is at 39.000 MHz (1 MHz above CB-chan 30) and mixes with I.F. freq. of 10.695 MHz for a difference of 28.305. For phase control, the 39.000 is also mixed with a 40.210 MHz reference for a difference of 1.210 MHz which requires a div-by-121 to reach 10 KHz. We had to ground pin 8 to avoid a minimum count of 128 (we need 121 or less). We still have fixed divisor of 64 (pin 9 tied HI), so the selector channel needs to supply an additional 57 which it does in Chan-6 position by switching pins 10, 11, 12, 15 HI, and grounding 13 & 14. After these two simple changes, the radio came to life immediately. However since I had the SAMS book with all the pictures to identify components, I went thru and tweaked up the circuits that now operate at higher frequencies. It did as you would expect improve considerably. Those without documentation will need to proceed carefully. The inductors near the RF Power out and its driver should be easy to identify without docs.
Finally, I also mentioned an older 23-Chan Cobra model 135. I have not changed it over yet, but in analyzing the documentation, I feel certain it would be easy to convert by simply replacing quartz crystal X10 (8.409 MHz) with one 9.5 to 9.67 MHz ...a single crystal would provide four operating frequencies. Each new crystal in that range would offer four more operating frequencies. In this model, the sum of two crytals (one from each group) combined with the 7.8 MHz I.F. yields the operating frequency.
Both models have the "clarifier" function in Receive, which shifts operating frequency plus or minus....perhaps filling in most of the gaps in the channels separated by only 10 KHz. If desired, it should be an easy task to modify this same circuit to include shifting the Xmit frequency also.

I FORGOT TO MENTION that on the Midland modification, Chan-21 on the selector yields the High end of the Novice band at 28.495 MHz. The dial limits should be marked clearly, or perhaps a physical-stop on the older dials if only the Novice band is intended.

His Email is LOU@CBCINTL.COM

This will append the previous entry called EASY CB to 10M SSB: This offers another nice option if it is to be used on Novice band only (This applies to the Midland 79-892 model). The PLL-02A IC offers the option of moving in 5 KHz steps, by simply grounding pin #4. In this case, pin #8 does not get changed (stays high as it is originally). We need the higher divide-count to reach the 5 KHz phase reference (double the count required on 10KHz).
The same instructions changing the VFO still apply. In this case, the 28.305 frequency is not available because of the glitch in selector switch which was necessary to accomodate those "20 KHz step" exceptions. The lowest frequency will now be 28.310 which corresponds to Chan-12. (Technically, 28.300 USB on Chan-11 might be permitted, but I would not advise it). The operating frequency moves in 5 KHz steps as the Channel selector is advanced (except for the 2 or 3 glitches where it advances 10 KHz). But there are not enough switch positions to reach the high end of the Novice band so that Chan-40 corresponds to 28.460 MHz. With the smaller 5 KHZ steps, it is almost certain that the clarifier will fill in the gaps with possible exception of the 10 KHz "glitch" channels.
From looking at the schematic it appears to be a simple matter to add a "Delta-Xmit" pot to shift the Xmitting frequency during Xmit only. Replace R-26 (10K) with a 100K pot...using two of its terminals and locate the pot in a convenient location. Run a shielded line to replace R-26. Be sure to verify which end of R-26 is ground. Add a 0.01 ufd across this location. This should work well, because an almost identical circuit is used to place the "receive clarifier" pot remotely in the Hand-mike.
...One small correction in the original article....at one place in the text I mistakenly referred to a Cobra-135. It is model Cobra-138.

Someone ask about a schematic for a Kraco 4060 CB-unit. I don't have info on that model, but I have some notes on Kraco KCB-4020 (AM 40-chan), and KCB-2320B (AM 23-chan). Both use the same PLL-02A IC in the synthesizer system..... i.e. divide-by-n (1 to 512). Exactly the same theory applies as was mentioned in the earlier post (EASY CB-to 10M SSB). The same 10.695 MHz I.F. frequency is used.. the main difference is that the Midland used a reference of 40.210 MHz, while the Kraco's use 40.960 MHz to down-mix the VCO frequency to the 2 or 3 MHz range, suitable for div-by-n (512 to 1) to reach the phase-det ref of 10 KHz.
Again, on the PLL-02A, pins 7 thru 15 (activated when HI) yield divide-by: 512,256,128,64,32,16,8,2,1 in the same respective order. Dividing factor is the sum of all the pin-values which are held HI (+5v).
The 23-chan Kraco only switches 5 lines. The 40-chan Kraco switches 7 lines,

while the Midland 40-chan switches 6 lines.
Incidentally, if you have schematics, you may not see those higher (40.210 or 40.960) indicated...they get their final "doubling" covertly in the VCO-Mixer I.C. The 40.960 is four-times the 10.240 MHz Xtal, which conveniently mixes with the upper I.F. freq of 10.695, to yield 455 KHz which is the 2nd I.F. (used on RECEIVE ONLY). If you want to review the theory that was posted in the earlier "EASY CB-to-10M SSB" post, I can E-mail you the files:
gene@eagle.csl.uiuc.edu

About a year ago I posted some rather detailed instructions and concepts for modifying CB-SSB transceivers for use in the 28.300-28.500 MHz Novice band. (I still have the old files and could e-mail them to anyone interested).
I did not investigate, but one reply also suggested that LOU@CBCINTL.COM sells a book with conversion information.
I took the model I converted (Midland Model 79-892) camping last summer and managed a couple of QSO's on a mobile whip, although conditions were not great. I had converted it so that the XMIT changed in 5 KHz steps (except 2 or 3 places jumped 10 KHz due to the unique allotment in the original CB-channels). BUT with such a weak signal, I found that being able to shift frequency either side of the 5 KHz steps was necessary, so as to get exactly on the frequency of the station being heard. I therefore further modified the trans-ceiver so that the so-called "clarifier" that several models use on "receive only" was connected so as to change BOTH Xmit & Rcv identically. This turned out to be quite simple, at least on my unit. Of course with a little more complication, one could add an additional pot and switch so as to zero a station, while Xmit & Rcv are identical, then throw a toggle-switch to provide RIT (Receive-Incremental-Tune) on receive-only but Iconsidered this over-kill for such a low-power transceiver unit.
I did this by cutting the control-voltage wire to the Xmit-diode/resistor (D-5, R-25 on my model). I transferred the control-voltage wire to the Rcv-diode/resistor (D-4, R-24) to a constant +9v (regulated). This was about 1 volt higher than the original control-voltage, and gave me a little more frequency-deviation, which is accomplished by "pulling" an Xtal-oscillator, (i.e. VXO) which of course has limits. The result, was a frequency shift of 3.5 KHz (+ or - 1.75 KHz). Of course it would have been nice to have a shift of + or - 2.5 KHz, which would fill in the gap completely between the basic 5 KHz steps (on most channels), but I considered it fortunate to get this much shift so simply, and with no complications with the Xtal oscillator.
The above-mentioned diodes (only a single diode D-4 after my modification) provide dc-bias to the varicap (D-3) whose capacitance is included in the Xtal-oscillator's circuit.
With the 10-meter band beginning its slow rise to improving conditions this year, perhaps 5 or 10 watts will enjoy success even without a linear amplifier.
With the FCC's new concern about radiation and power levels, there will certainly be no concern with this power-level!

I should point out that when the 5 KHz option (on the PLL-02A synthesizer) is chosen, you can't quite reach the top of the Novice-band....the highest

on the Chan-40 position is 28.462 MHz with the variable pot at maximum. Also, to remain safe you should use Chan-12 as the lower-limit (28,308.5 with the variable pot at min). Although it might be risky, on Chan-11 you can tune down thru 28,300, to 28,298.5 which of course is illegal.

274. SSI DTMF Decoder ??

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-13 00:00:00 UTC
From: Duffer <hduff@ica.net>
Message-ID: <39469226.7F561D75@ica.net>
Source record: 60044

Does anyone know who the manufacturer of the SSI-202 and SSI-204 DTMF decoder chips is ?
Furthermore, where can I get some SSI-204's from ?

Thanks.

Source record: 59949

"J",

Circuitry variations are not as critical on the low freq. bands, as the variation, or error, would most likely be a small fraction of the wavelength and thus not mess-up impedances much. (The lower freqs have wavelengths "closer" to D.C. than the higher freqs, thus the jibbing). Whereas a wiring error of the same dimension applied to a VHF, UHF or SHF circuit would represent a much greater proportion of the wavelength, mess-up impedances, and cause reflections of energy big-time, usually letting the operator know in very unforgiving and distinct terms that something is askew. Consequently, building or repairing VHF/UHF circuits is going to be a more demanding and critical endeavor than for the lower, H.F., or so-called "D.C." bands, while keeping in mind that the "wavelength" of D.C. is infinite.

Regards, Ed Wawzinski, K3FDY

Take out the 4 phillips screws, chack the meter movement.
The meter is shock mounted, but not perfectly so.
The biggest problem is dropped meters that stick due to bearing
misallignment.
(Looks like intermittent.)

If the meter is good, clean the slug contacts.

Silicon Systems Inc. was the origional source, but I believe they were
bought by .... someone.
Distributor listed in an old catalog; Har-Tech, 416-665-7773 in Ontario.

Hi two other areas have found can give trouble are badly made contacts to
the coax from the line to the meter. Either the sceen connection at the
connector end or I have seen an intermittant crimp spade where it connects
to the meter terminals. Clean the silver contact that connects to the slug
carefully with alcohol make sure ut has not become twisted by careless
insertion of the slugs.
Hope that helps....they can normally be made to work reliably.

I have all the info somewhere. Just by memory, I think SSI
was Silicon Systems Inc. RCA second sourced the 202 and
perhaps the 204 in their CMOS Logic series (e.g. CD22204
or something like that.). I believe Circuit Specialists
carry the RCA version of the 202. Email me if you
need me to dig deeper.

285. Need help on active antenna design

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-14 00:00:00 UTC
From: snark@yourself.com
Message-ID: <3947f115.328305@news.conex.com.br>
Source record: 59958

I need to use a short (60 cm - 2 ft) whip for reception from a few hundred kHz up to at least 100 MHz. I gather that at low frequencies such a short rod will present a rather high impedance, but all the RF designs I have at hand seem to presume a low-Z source. Will connecting the rod to a simple jfet or mosfet gate solve the issue? I'd like to have some hints on this, schematics, component values, active device recommendations, links etc.

- Snark.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 18th 2000
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23-W1BOS/R and W1XM/R-449.725/444.725 (PL 114.8/2A).

A socially inept, gay person of Southeast Asian origin? All this hostility over some sloppy proofreading, really! I will answer the original question (what kind of nerd would wear his callsign on his hat?): the same kind who wears a belt *and* rainbow suspenders, an elastic strap to keep his galsses on his head, and two earphones (from different HTs), usually seen stalking the aisles of hamfests for a $50 SX-88, or holding up traffic at a green light while he changes taps on his homebrew bugcatcher.

This fellow may be a poster-boy, but it isn't for ham radio, I am sure.
Notice, no call sign, and a preponderance of other clues (name, diction,
tone) that suggest he is a bootlegger and/or "freebander." Please form
an opinion of hams and ham radio based on what you hear on the bands,
not on what you read on USENET, and welcome!

Hello--
International Rectifier (IR) makes (or made) these--
they're 200V Vds, 0.4 ohms Ron, 6A Id.

Idss is 0.1 mA at Vgs = 0
Vgs is 2 V (minimum), 4 V (maximum) at Id = 1 mA

Ciss is 700 pf typical
Coss is 250 pf typical
Crss is 80 pf typical

Theta junction-case is 1.67K per watt max.

Hope this helps-- I'd be pleased to send you a photocopy if you can't
locate more-detailed
specs on line.

73,
Brad AA1IP

I am looking for plans to builb a low power (1-3 watts) FM transmitter, I have seen units at Target that broadcast your cd player on 88-107Mhz. I am looking for one with more power than the Target one.

Congrats on the new ticket. You'll have a lot of fun with ham radio
and it could turn into a lifetime hobby.

You can buy crystals at International Crystal. Just give them the
name/model of your radio and the frequencies you need and they'll
do the rest. Their particulars are:

http://www.icmfg.com/
1-800-725-1426

I suggest before you tie up a lot of money up in a multichannel
crystal radio that you check the various swap groups like
rec.radio.swap and locate a synthesized handheld like the HTX-202
and never buy another crystal again...and yes, normally two meter
channels above 147 MHz transmit 600 KHz higher than receive, but
check to be sure of your particular repeater.

Yes, I fully intend to have a modern mobile, and modern HT, once I get
the money saved up :-)

I'm starting here because:

1) it only cost me $15 so far, and I bet I can get on the local
repeater for under $50. It may not be pretty, but it's a start.
Besides,

2) I know a bit about practical electronics, and want to get more
practice. this looks like a good way.

Thanks for the web site, I'll be getting the crystals once I overhaul
a microphone (to use a 1/4 inch plug) and test the transmit section.
I already know it receives...

Message-ID: <8ibeum$930$1@ncar.ucar.edu>
Source record: 59982

Wanted: Hex nuts and lockwashers to fit SMA connectors.

Hex nuts are 0.250-36 UNS-2A and measure 0.312" across
the flats.

Lockwashers are 0.400" OD and are internal tooth types.

Have several connectors but missing the hardware to go
with them. Have not found any company that sells these as
an individual item. These are typically gold-plated hardware
items.
Anybody have this hardware to sell, or know where they can
be found. I've already checked with a few of the major
suppliers of electronic hardware.

Thanks!
Chip, NW0O

310. Source for Dry Transfers

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-15 00:00:00 UTC
From: Ron Farren <ronfarren@mindspring.com>
Message-ID: <8ibnck$16o$1@nntp9.atl.mindspring.net>
Source record: 59983

I have been inactive for 20+ years and am finally getting interested again. When I was active my focus was on building various pieces of equipment for the shack. I have started building again and can't seem to locate a source for Dry Transfers - you know, those letters and numbers that you can "rub on" to a panel to show what all those switches and knobs are for. Post-it notes keep dropping off and I am getting too old to remember without some reminder.

I can't remember who made them although the name of Datak comes to mind. I have looked through all of the various catalogs I have but have not found anything yet. Neither have I found any reference to a source via a search of Dejanews. Before I have to resort to a black marker pen, maybe someone could let me know where to find them. I think even Radio Shack had them at one time.

Thanks in advance for any clues.

Michigan's Governor has declared next week "Amateur Radio Awareness Week" in the state.

And a great week it is, too.

It starts off with the Michigan Hamfest Weekend featuring the Midland Hamfest on Saturday and the Monroe Hamfest on Sunday, and wraps up with Field Day.

If you're going to be in Michigan this weekend, come up to Midland and visit the Midland Milleneum Swap (http://www.qsl.net/w8kea/MARCSWAP.htm). Camping is available at the site, so you can come in tomorrow night and be there bright an early for the Midland swap. Afterwards you can head down to Monroe for the swap down there.

AND there's a good chance that it won't snow!

TDK. Also, the parts were renumbered (or a new version came out) as
the 75T202, etc. RCA (now Intersil) and Crystal and somebody else
made them. Motorola had(?) a version of the 204 with some MC145xxx
number. the JDR Microdevices web site, http://www.jdr.com, has the
Motorola one and the 75T202 in the Integrated Circuits -> "Phone and
Clock Circuits" section.

Also look at the BASIC stamp from parallax (www.parallaxinc.com). Their BS1-IC is just about as tiny as it gets, and has enough "horsepower" to do the CWID with no sweat. I'm using several of them as repeater controllers (CWID, tail timer, timeout timer, and courtesy beep) with code space to spare. You could also add a cap and a thermistor and have it send you the temperature since it can do simple A/D conversion as well. If you want to see what my repeater controllers look like, check out:
http://www.tisd.net/~harveybppp/repeat.html
Sample code for doing CW is on the parallax web site, so it's a "no brainer" to get going. They also have freely downloadable BASIC compiler on the site, and schematics for making a cable to go from your PC printer port to the Stamp to download the program to it.

Er, no. I'm not paying for the repeater access (although once I start
using it I'll probably help support it). I'm trying to get the radio
set up to use it without investing much $$, And I'm aware of the
CTCSS issue, I need to talk to the operators about that, rumor has it
there is a way around the problem (at least on that repeater).
I have two of these radios, from which I am building one working
model. One of them has a tone board, but I have not idea (yet)
which tone...

Message-ID: <394a75bd$0$10907@reader5>
Source record: 59901

(Also posted at QRP-L.)

Hi all,

For our ham/jota station we need some idea's, pictures, constructiondetails, hints, tips..... about placing a Ham IV rotator + 3el. triband (FB33) yagi in a mast.

The problem is that the mast is a round pipe, and about 4,5 inch diameter at the
top. At the moment the rotator, topbearing and antenna are placed on top of the mast in a kind of cage-construction. We can climb up until just under that construction, so keeping the stuff in repair is not possible without the help of a crane or so.We would like to make a construction with the topbearing at the highest point of the mast and the rotator 3 feet lower, all beside the mast. A kind of parallelconstruction. We are not able to turn over the mast so all the work must be done up 18m high using bolts, clamps etc.

I hope, I've been clear enough for you all. So mail me, send pictures, constructiondetails or url's where to find them. It will be a great help for us.

72, Carel, PA0CMU.

Greetings,

When did they stop putting tubes in radios, TV's etc.?
I'm looking for pointers on what out look for at the yard sales, etc.
My neighborhood has an avg. homeowner age equal to the sum
of their soc. sec. digits multiplied by the number of those digits.
<grin>. Nice folks, though.

Andrew

325. DTMF encoder chip ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-16 00:00:00 UTC

I'm looking for a parallel loaded DTMF encoder chip. I used to use the
National TP5088 but it has gone obsolete.
I'd prefer a footprint compatible substitute. Failing that, any other
parallel binary input DTMF encoder would be fine.

Anyone ?

Thanks de Hugh

Something is amiss with the schematic.
You need a 51 Ohm 2W Carbon Composition
resistor right at the input prior to the coupling
cap. With at least .5W in you'd get 7.07V peak
voltage, which should be enough to drive the
device into Class C. Otherwise you'd have a
High Z load and possible oscillation problems,
even with the ferrite beads.

Electricity doesn't play nice with the human body.

There are actually 2 dangers: first, paths across the heart can cause the heart to fibrillate or stop and; second, electricity can burn flesh. Either of these effects can be fatal. You can get burned with 100 volts, but it probably takes closer to 400 volts to cause serious burns. Heart failure is an entirely 'nuther matter. As little as 6 volts, under ideal conditions, can kill you. This is pretty unlikely, but it starts to get to be a common thing around 100 volts, and 200 is probably optimum for killing you. As you go above 200 the electricity wants to follow the skin and avoid the heart, although as you go higher still, you start to drive more current where it can do some damage, and the outer parts start to char making them poor conductors.

The simple answer is, don't open the case.

If you need to work on the device, know what you are doing. Obviously, don't work on higher voltage circuits when they are energized if at all possible. Also, you need to understand the circuit. Many circuits can store a charge for a great length of time, so simply unplugging the device may not be enough.

Typical safety precautions include making sure the floor is ungrounded and that there are no grounded things to inadvertently grab, and keep one hand in your pocket making it hard to find a path across the heart. And of course, be sure you are using insulated tools. Certainly don't touch stuff with your fingers.

But the simple answer is the best - unless you understand the circuit and thoroughly understand the risks, don't open it up in the first place.

Let me explain. Being an RN I certainly know this already.
I also know that Hams scrounge parts from old devices and I'm
wondering how they provide for their safety and what parts are
most likely to cause harm and how to discharge any residual or
harmful voltage that may still be in the device. BTW, you're 100%
correct about the dangers of fibrillation, most people don't know
just how easy it is to make a human heart fibrillate. In the ICU
where I work even milliamps are potentially fatal to fresh heart
attack victums, etc.

Thanks,

Andrew

The conversion was made around the early to mid 70's. A lot of the televisions at that time that went solid state still looked a lot (and weighed close to) their tube counter parts. But it's fairly simple, the word "solidstate" was used as a marketing buzz word by most manufacturers and you can almost always tell the difference between tube and transister by looking at the front panel of the TV/Radio in question. If you see the word SolidState somewhere close to the tuning knob then it is transister, if it does not it will probably be tube based.

Ron,

I have seen them under the Datek name or something simular at larger staionary stores or drafting supply stores. DYNA makes new fangled labelers that are light years ahead of the old ones also; same source. I do pretty good with post-it's as short term memory reminders, but I usually cut them down to just the sticky part.

Hope this helps!

Hi Robert,

I started with one of those cd broadcasters from R.S. and added an
amplifier.
I like it because it is stable and I could switch it to any of four
different frequencies.

Russ:
D.C. Electronics also supplied a two page, mfg. spec. sheet which I have. Along with operating parameters, and suggested circuits, there is given a "systems block diagram". The 414Z has four RF amp stages and a transistor detector, no audio amp, ten transistors in all. The input impedance is stated as being very high. Threshold Sens. is 50 uv, bandwidth 4 KHz.. AGC is detector DC component fed back through a 100 K to the first RF stage. The 414Z is the basis for the 415E and 416E, which in the larger 8 pin DIP package, merely include low-level audio amplification for headphones. Vcc is 1.3 Volts. The orig. mfg. was GEC Plessey Semiconductors......

334. Total Newbie Pt. II (long)

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-16 00:00:00 UTC
From: cathexis@erols.com
Message-ID: <39497643.1381170@news.erols.com>
Source record: 59990

Greetings again,

First, a brief preface:

Hi, I'm Andrew. I'm 45 y.o. and I live in Fairfax, VA. which is in the D.C. suburbs. Four days ago I made my first post here ("Total Newbie- Sticker Shock"). I was really gratified at the feedback and I want to thank each of the 10 respondents for their info; Had no idea how much help was out there. I also liked that I didn't get flamed for being a newbie (some ng.'s. will do that).

Now I'd like to get started with some more "clueless" questions and advice-seeking. I want to tell you what kind of things appeal to me, what books I've been able to access, ask some trivia, and then,... Ask you to rate my junk. That is, it seems that many of you are scroungers (a noble and time-honored practice) and have boxes of "junk" lying around that you use on projects. I really like that idea because it's cheap, creative, fun and because I'm a pack rat. I've come up with a long list of *every* piece of electronic junk I've got laying around the house. I'd love it if you'd rate it ("junk", "keep") and maybe tell me why it's useful. I know, I know; scroungers throw nothing away but I think you know what I'm getting at. With that said, I guess I'll start with the list first.

Here's the whole sheebang in a long list to make ratings easier:
(Please, no laughter.)

1984 Fisher 19" Color TV, model no. PC-200 (avg. powr 91w, 120AC, 60Hz, 2.0 amps max)

Circa '85 Panasonic Radio model RX-C39, Matsushita Elec. Indus. Co., Ltd AC120v, 60Hz., 21W with twin detachable speakers(separate woofers/tweeters) that say peak imput 17W, Imp. 3 Ohms. Also has a graphic Eq. with controls for 125Hz, 1Khz, 8Khz. NOTE: Tuner knob is broken and so won't get anything, but probably mech., not elec. parts are broken. Also has broken tape deck: Your typical Boombox from the mid-80's. AM/FM only bands.

'85 Nikko RC "Ferrari" says 27.145Mhz. Both controller and car have corroded batt. connections from old batts. left in forever.

Phones:
GE model 2-9831A "Digital Telephone Answering System" with fully dig. (tapeless recording) Answering sytem. mid '90's

Bell "Excursion 6000" cordless with base unit ("radio ch.4")

Motorola Micro-Tac DP C550 cell phone circa '95 (basic flip-phone)
with batt., charger may be around somewhere.

Radar Detectors:

Micronta (Radio Shack) Road Patrol XK

Another (same as above, but with "dual superheterodyne")

Koss TD/70 Digital Headphones (only 1 "ear" works)

"My Buddy" sm. personal alarm. Pull pin, go deef- torture dogs,kids, etc.

Yamaha MRX-100 Universal Remote (TV's too old for remote to "read"it)

Sega Genesis 16 bit, broken (Kids did that one).

Tandy "Sensation" 486 DX-50 with 101meg :-) HD with Creative Labs X4 CD drive.
BTW, I've also got the original CR-rom drive, it was X1 (!!) speed. <grin> Circa
'91.

In addition, I've got a couple of hand held mikes (Labtec AM-22's, 600
ohms), the kind that used to come with your multimedia computers. Remember
"Multimedia" computers? Also, some DC(?) cig-plug adapters, assorted phone and
Coax cable and maybe some AC adapters laying around somewhere. Also, a
keyboard, old mouse, dot-matrix printer and a couple of joy sticks and game
controllers. Could you get anything out of these items? Pitiful, I suppose.
Anyway, there you have it. Any of these can be chopped, mangled, scavenged,
or otherwise "used" in any way.

What do I want to do?

Well, I guess I've got to start with CW which means learning Morse. I
can do that, but I'm really much more interested in voice. No offense. Certainly
willing to start small and work up.

I've also come across some interesting web-sites on "Natural Radio".
You're familar with this? I think it'd be cool to build my own reciever for
same. The best web-site has apparently yanked his schematics as he wants me
to buy one of his own models. I hope he makes a mint, but I not ready to do
that.

I like AM talk-radio (Coast-to-Coast AM, etc.) and would like to make
my own loop antenna. I would also enjoy AM-DXing and hunting for pirate
stations. In fact, I find the whole subject of antennas very interesting. I went
so far as to go to the library today to research the NEC and BOCA codes for same
as Fairfax (and VA.) subscribe to them as law. It seems that no permit would be
required for almost *any* length of strung wire as long as it was grounded,
secure and no more than 12feet over your roof. It also seemed to make special
ref. to "transmitting antennas" over 2feet as needing a permit. I need a permit
for a Yagi? Not sure on this. It's regarding "Dish Antennas", but is very
loosely worded.

Books:

Local library has ARRL handbook, Carr's Antenna handbook, etc. But
the ARRL hdbk. only is there in 77th, 76th, and 75th(?) ed. I checked out the
77th and also, "Electrical Components; A Comp. Ref. for Proj. Builders", D. Horn
which I like because I know almost nothing, can't yet read schematics and the
sheer size of the ARRL Handbook is daunting. Can find no old mags. other than
last few years of Pop. Sci. and Pop. Mech.

Trivia Questions:

1. Okay, I now know that my touch lamp and dimmer switches will give incredible
amounts of AM interference. Why?

2.If you guys are "Elmers", what am I ? Also, what is the origin of that word?

There you have it. If you've made it this far, have a tall cool frosty
one on me. You are an Elmer who will take a seat of honor at Elmer Valhalla;
where each day an endless supply of any type of tube or part is granted you
for any project, any size, which magically disassembles itself each night so you
can build and re-build ever more magnificent projects the next day. Thank you!

Andrew

335. Need some LED's

336. Will Pay $$$ for you to build me a simple circuit! Help!

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-16 00:00:00 UTC
From: Les Rayburn <les@highnoonfilm.com>
Message-ID: <skje7e96is4172@corp.supernews.com>
Source record: 59992

I am an extra class ham, but not very handy with a soldering
iron. I work mostly 160 meters but am also active on the
1750 meter LF experimental band from 160-190khz.

I need someone to build a final rf amp that I can mount at
the base of my antenna. It's a fairly simple circuit and I'm
willing to pay ANY reasonable price.

I've got a lowfer beacon on the air now, and working pretty well. The
unit produces about .96 watts of drive...however, I have pretty
long coaxial run to the transmitter and am losing a lot of energy.

I'd like to mount a final amplifier at the base of the antenna outdoors
and feed DC power to the amp via a separate cable. I dug through some
of my old "Lowfer Letters" and found a fairly easy design by Vince Pinto
(VP)
that I'd like to find someone to build for me.

It uses the IRF series of Mosfets, including the IRF511 or IRF741. I'd like
to
have the unit be capable of higher power output (up to maybe 20 watts
or so) in case we get that amateur LF allocation later.

If you're interested, I'd be willing to pay any reasonable price to have the
project
built. Payment can even be in advance. If possible, I'd like the amp by the
end of July, as I plan to do major antenna work then anyway, and I'd like
to mount and test everything then.

I've attached a .GIF image of the schematic, or you can view in on my web
page at:

Lots of useful stuff there.

> 1984 Fisher 19" Color TV, model no. PC-200 (avg. powr 91w, 120AC, 60Hz,
2.0 amps
> max)

Rip out the PC board and throw out the cabinet and tube is space is tight.
I tend to leave the
components on salvaged boards unless I need them for a project - stripping
boards of all parts
takes too long otherwise.

> Circa '85 Panasonic Radio model RX-C39, Matsushita Elec. Indus. Co., Ltd
> AC120v, 60Hz., 21W with twin detachable speakers(separate
woofers/tweeters)
> that say peak imput 17W, Imp. 3 Ohms. Also has a graphic Eq. with controls
for
> 125Hz, 1Khz, 8Khz. NOTE: Tuner knob is broken and so won't get anything,
but
> probably mech., not elec. parts are broken. Also has broken tape deck:
Your
> typical Boombox from the mid-80's. AM/FM only bands.

Speakers could be useful to plug into a homebrew RX or txcvr. Audio amp
could be
a modulator for AM transmitter (not a beginners project though).

Also variable capacitor, ceramic filters, ceramic capacitors, ICs, etc may
be useful.

> '85 Nikko RC "Ferrari" says 27.145Mhz. Both controller and car have
corroded
> batt. connections from old batts. left in forever.

You don't yet know it, but you have a real gem there. Carefully take out
the crystal and
put it into a fundamental crystal osc circuit. You'll get about 9.050 MHz.
Convert the
oscilaor to a VXO and see what shift you get (should be 5-10 kHz). Put it
through a
frequency doubler and build a driver/PA/keying circuit.

The result is a QRP CW transmitter for 18 MHz that can cover a fair
proportion of the CW end

of the band. Same is true for 27.125 MHz crystals.

> Phones:
> GE model 2-9831A "Digital Telephone Answering System" with fully dig.
> (tapeless recording) Answering sytem. mid '90's

Might be fun to use as an automatic CQ caller on HF - a bit of messing around - keep this
for when you're more experienced.

> Bell "Excursion 6000" cordless with base unit ("radio ch.4")

Again a source for crystals. Or you could convert it to 10 or 6 metres FM.

> Radar Detectors:

Convert to 10 GHz?

> Koss TD/70 Digital Headphones (only 1 "ear" works)

Maybe worth fixing so you can listen to homebrew receivers with no wires. Otherwise
pull apart.

> "My Buddy" sm. personal alarm. Pull pin, go deef- torture dogs,kids, etc.

Try reducing voltage to sounder to see if it can work as a Morse oscillator. If
it doens't use it as an alarm for shack equipment (tie one end to txcvr, other to table).

> Yamaha MRX-100 Universal Remote (TV's too old for remote to "read"it)

Scrap components value only.

> Tandy "Sensation" 486 DX-50 with 101meg :-) HD with Creative Labs X4 CD drive.
> BTW, I've also got the original CR-rom drive, it was X1 (!!) speed. <grin> Circa
> '91.

Case could be useful? Also voltage regs, etc. Crystals and osc modules also.

> In addition, I've got a couple of hand held mikes (Labtec AM-22's, 600

> controllers. Could you get anything out of these items? Pitiful, I suppose.
> Anyway, there you have it. Any of these can be chopped, mangled, scavenged,

> or otherwise "used" in any way.

The main rule is don't throw anything out initially. When you get more experienced you will
know the difference between good junk and bad junk. There are many things I threw out or
wrecked that I now regret.

> I've also come across some interesting web-sites on "Natural Radio".

Directional multiturn magnetic loops work very well for AM. Can even use indoors.

In fact, I find the whole subject of antennas very interesting. I went
> so far as to go to the library today to research the NEC and BOCA codes for same
> as Fairfax (and VA.) subscribe to them as law. It seems that no permit would be

the
> sheer size of the ARRL Handbook is daunting.

Knowing Schematics is an absolute must. Go to the ARRL book and study the
page
showing schematics until you know them off by heart (at least the basic
components).

> Trivia Questions:
>
> 1. Okay, I now know that my touch lamp and dimmer switches will give
incredible
> amounts of AM interference. Why?

Probably contain something that switches fast to reduce the energy present
at the light.
Fast switching causes sudden transients which can radiate if
unshielded/unsuppressed.
Like switching on an electric shaver.

Les,

Obviously I don't know anything about how you are set up there, but
the loss in even some pretty cheap cable at 190 KHz should be so low
that you can't measure it on a run of less than a couple hundred feet.
If you are going that far the drop on you power leads may be a problem
.....

Not trying to re-invent the system, just wondering what's going on
....

342. Re: WARNING ! DANGER WILL ROBINSON, DANGER !!

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-17 00:00:00 UTC
From: Bob Camp <bob@cq.nu>
Message-ID: <Mmz25.190$_q3.3639@news02>
Source record: 59915

In general most common ham gear (other than linears) does not contain anything that is much danger once the power is removed. The danger in this area comes from capacitors that are charged to high voltages and built into circuits that do not automatically discharge them when power is removed.

A category of stuff that is a problem in this are is anything with a CRT in it. Computer monitors and TV sets are prime examples of this kind of stuff. Normal procedures are to discharge the high voltage capacitor(s) with a grounded tool after the line power is removed and before the equipment is worked on. I usually use a plastic handled screw driver grounded to the chassis with a nice big clip lead.

The high voltage power supplies in most linear amplifiers should be treated the same way, however most have resistors on them that will discharge the capacitor bank fairly quickly.

The other thing that the stickers are waning you about is to not run stuff with the covers removed and power applied. Obviously this is a different category of problem.

Hope this helps ....

Bob

My thoughts as well. My Uncle would skip using coax altogether on the lower marine bands. The loss just did not make coax worth the effort.

Any tube radio (in decent shape) probably has more value on EBay than it did when it was originally sold. Can't say the same for TV's -- although there are some very interesting things you can do with an analog TV UHF tuner.

Although I sometimes suffer from the tube affliction (male philotubitis) , I have found it better to immediately list things we (my sons and I) find at the Millburn NJ dump and at house sales, than to plug them in and see if they work.

Andrew,

The stuff you want to discharge stores energy. Avoid, batteries, but go for capacitors. Inductors do not store enough energy long enough to be a problem.

The only capacitors big enough to be an issue should be in the power supply. In a high voltage supply they may be potted, or otherwise shielded. In a normal supply they should just be sitting there.

Most power supply capacitors are round, with plastic jackets on them. The fancy name for them is aluminum electrolytic capacitors. They usually have markings like "6800 mfd 50V" (voltage and value may be very different though) on them. Most tech's will recognize them from the simple description of "power supply capacitors".

Hope this helps.

Bob

Might anyone out there is Amateur Land have a Schematic for a
Regency EC175 Frequency Counter. My unit seems to be missing
the first decade stage. When I connect it to my FT-101 all I get on
10 meters is blank, blank, 8.xxx. I hope it would read 28.xxx. Maybe
if someone out there has another counter that they are willing to part
with for a small sum, I might best consider that direction. I just got
upgraded to General and want to go on for my first contact with HF.
Thanks and 73's everybody Don Smith KB6GQA

There's no real mystery to toroids. Why not just recalculate it for a core you CAN get? The Handbook has all the winding data, tho there are several places on the net with nice charts so you don't even have to do the calculations.

I have an interesting chance to purchase some nice RCA AM transmitters from the 1940's to 1950's (and possibly earlier) in various stages of completeness very, very cheaply before they are broken up for parts and surplus.

First of all, does anyone know what models were made in that era and can give me the numbers and data?

I need manuals ; i.e. ; Parts, service, mainenance, owners, installation, etc.

Are original parts and tubes still available? If anyone has anything that will work with these transmitters email me with what you have and prices.

They will be made to go back on air by a local non profit AM radio station.

Thanks,

Some of the older radios were a whale of a lot easier to use too!

Icom used to have some thumb wheel controlled HTs which were really rugged.

Todays radios can do most anything, IF the user can fugure out how to do it and has good eyes and nerves. (Those tiny buttons are a real challenge for some one my age<:-))), but there are times when I wish for simpler (to use) radios in a good many situations. I will add that many, if not most HTs are not nearly as rugged as many of the old simple single band ones, but the technology is far better.

When I started in Ham Radio as a Novice I built up a pair of 6L6 tubes and a 6AG7 oscillator (The circuit was in the ARRL hand book). For a receiver I had an old Hallicrafter's S40-B that had a Heathkit Q-multiplier. The receiver was already old at the time.

It may have required a hand on the tuning knob (wee bit unstable), but that receiver was cheap. I learned how to copy with my right hand while keeping the station tunned in with the left.
>
With some luck and a little money you can find some reasonably priced HTs, or VHF mobile rigs to use as a base station.

If you are willing to settle for Old, Big, Heavy, and tubes, you can find some of the older HF rigs (separate transmitter and receiver.) for some decent prices if the collectors haven't run the price up too high.

Also some figure their old rig must be made of gold.
Hit up a bunch of Ham swaps with some of the locals who can point out the good deals and the stuff that might be a waste of money. Also they may be able to check out the rigs at the swap to make sure they work.

I purchased an SX-101A, and SX101 Mark II HF receivers for $25 and $50. I found an HT-32 transmitter for $35, or $40 (forgot which) and an HT32A for $75.They run 100 watts output on SSB and CW.

No, these are not my regular station, but I have a soft spot for the old rigs and I probably will set the whole station up in my shop/garage.

My garage/shop is more of a hobby shop and machine shop rather than a car type garage and I'm currently using it to build up some of the stuff for my new tower installation.

Good luck,

DE

<snip>

My first "station" was a 2m ht (HTX-202)that I picked up from a friend who decided NOT to get her license. I ran it off of a 5 amp power supply that I picked up at the pawn shop for $10. I used a homebrew 4 element beam that cost me a total of about $15 and an afternoon to make it. I put it on top of a 20 ft. TV mast that was free (if you take it down, you can have it). I fed the antenna with some old coax from my CB (oops) days. In all, I probably had less than $150 invested and could work every repeater in a 40 mile radius on 5 watts. Look around. There are great deals out there to be had. I'm certain there are others out there who started off with much less. Besides, you get a much better understanding of how things work when you put them together yourself and make them work. That's one of the principles of amateur radio that first (and most) attracted me to the hobby.

Hi Gang,
I'm working on a high-power homebrew autotuner and need some advice about the tuning algorithm. I'd like the algortithm to use conjugate matching, but am not sure how the math works. Basically, I want to measure the reflected amplitude and phase angle of the load, and have the software compute the inductance and capacitance needed to transform the load to 50 ohms. This kind of scheme is used in several commercial transceivers -- e.g., the Kachina -- but it's hard to find details. Can anybody help? Thanks and 73,

Jim W8ZR

You are right. It used a right angle mic connector. One of the pins
on a stereo type plug will trip the PTT (cause the relay to kick in
and transmit). The other lead is the mic hot lead.
Crystals if I remember correctly were in the 8 or 12 MHz region. On
the earlier HR2 or HR2A they used 6 MHz xtals for the transmitter.
The receiver used overtone xtals at 1/3 of the injection frequency.

It was manufactured in the 1975-77 time frame.

For Sale or Trade:

Uniden SC-150B 100 channel programmable scanner. Instant WX, data lockout, 10-banks. 100% electrical condx. Looks very good, except minor rubbing of lettering. With AC charger/adaptor and manual. $85 + ship.

Also I have a pair of Radio Shack 100 mW 5-channel 49 MHz FM HTs. Working 100%, looks great, but one radio is missing one of the case screws from the back, easily replaced. $35 +ship.

I would prefer to *trade* this stuff as a lot for a 2M mobile or HT (needs to have PL & repeater splits, and 5W at a *minimum*, tone-pad and memories would be nice also) in good working condition.

In addition to the other books recommended, I would strongly suggest acquiring a copy of "Radiotron Designer's Handbook," by F. Langford Smith. Get the early 50's edition (1953?) if you have the choice, it is the most complete book on the subject that I know of, and probably the "bible" of vacuum tube radio electronics. It contains over 1300 pages of information about tubes and tube circuits, including about a *hundred* projects (transmitters, receivers, amps, accessories and test gear) from the most basic to the more elaborate. Everything from the most detailed theory to very clearly written (and easy to understand without compromising throughness or accuracy; I think that modern electronics hasn't really gotten that much more difficult to understand, it is just that the quality of technical writing has fallen off a lot) chapters on building, testing, and operating valve radios. You can find a used copy for about $35-40, or buy a hardbound reprint of the 4th, 1950's edition for $65 from an electronics bookstore. It is also now available, unabridged, on CD-ROM, I believe.

It's called electricity, or more specifically, electric shock hazard. It seems some folks just don't know that electricity can harm you, so we must warn them. . .

Coax loss isn't the issue. The FCC Part 15 rules for operation in the 160-190 kHz band state that the length of the antenna, including transmission line (and ground wire if used) can't exceed 15 meters. Since the allowed length is already less than 1/100 wavelength, it is important to keep the transmission line as short as possible. That's why LowFER operators place the final amplifier right at the base of the antenna.

the antenna that you have in questions would have a extra 3 db gain
that would give you 13 db
now if you add another beam it would not give you 3 db
but it would only give you 1 db of gain and os on and soforth
hope that this will help

Time to straighten these things out. Stacking two identical beams can actually give you a shade more than the expected 3dBd of gain. Spacings etc have to be on the nose to get the higher figure.

By and large 3db is about right but you also have to take into account the losses in matching systems splitters etc. A good rule of thumb is that every time you double the size of the system you are going to see around 2.7dbd of extra gain. With this figure in mind the law of diminishing returns will not come into play.

Remember that if you are going to stack two beams [especially VHF and above] It makes sense to stack them one above the other. This way you get the extra gain by robbing the vertical pattern. To put it another way, the beamwidth does not narrow down in the horizontal. Stack them alongside one another and you get the extra gain by stealing from the horizontal pattern and the horizontal beamwidth tightens up.

388. home brew filter chokes

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-19 00:00:00 UTC
From: Kenneth Scharf <kjre@flashcom.net>
Message-ID: <394E903D.D52838F1@flashcom.net>
Source record: 59811

Been doing some 'reto' projects with tubes, mostly using some old parts from my junkbox. I found a dial from the National HRO receiver (don't think this one came out of an HRO receiver, though it's the same type of dial) and decided to build a simple tube set around it. I found some used power transformers at hamfests, but no filter chokes. I made two filter chokes from old filament transformers.

I first tried measuring the inductance of the primaries of two old rat shack filament transformers (6.3v at 1a and 24v at 1amp). They both measured out at about 1.5 Henrys on my old heath rlc bridge. These were the old type of transformers with plastic bobbins. I took the transformers apart and removed the secondaries. I then "added" more wire to the primary windings. In the case of the 6v xfmr this was #32 wire, the 24v #30. I added as much wire as would fit, fitted new flyleads and re-assembled. The 6v now measures at 3 Hny, the 24 at 3.5 hny. Going by wire size, the small unit should handle 90ma, the larger 150ma. When re-assembling all the laminations go the same way, not interleaved as originally. This gives a nice 'gap' to prevent core saturation when used as a choke. I didn't try to wind evenly as a machine would, If I had I could have fit more wire. A winding machine would have been nice. Maybe a rectangular dowel passed through the bobbin and chucked in my lathe run at the slowest speed.

RCA and others bowed out of the receiving tube market in 1977. Ham gear with tubes was still being made as of 1981 (drake C line was hybrid with some tubes in the signal circuits and finals). I built a Heathkit color tv in early 70's that was all solid state except for the CRT and HV rectifier tube.

Check out www.lindsaybks.com. He reprints old books from the '30's. Lots of early radio stuff. I recently built the 'twinplex single tube regen receiver. Uses a type 19 dual triode. Nice set. I am currently 'designing' a multi tube sw set around a circuit from his "short wave coil data book" (1937 gernsback). It will have a regenertive first detector (mixer) and separate oscilator, single IF stage, regenertive detector and two af stages. (probably 6J7 osc, 6SJ7 mix, 6SD7 or 6SG7 IF, 6Sl7 det, af#1, 6F6 af#2, 6X5 rectifier). Plug in coils will be home brew (tube base plugs glued to 2.75" lengths of PVC pipe). I have a nice vernier dial like from a National HRO receiver. You can find tubes cheap on Ebay (except for anything used in 'HiFi' audio).

I was considering building an 813 linear after finding 5 of 'em for about 30 bucks at a fleamarket. The 813 has an outrageously high output capacitance (about 14pf) so using more than 2 in a single ended circuit ends up with a very high Q above 20 meters. (Even two tubes is too much!). That's why link coupled push pull circuits were the rule when these bottles were king. One way to get around this is to use a roller coil and NO tuning capacitor on the highest frequency bands. Another is to use a 'series tuned' PI circuit. A third way is to use an 'L-Pi' circuit, the input inductor ends up being a stripline circuit. Better get out the smith charts to figure this one out!

An often overlooked configuration is the 'grounded grid tetrode, or cathode driven tetrode'. In this circuit you use filament chokes as in grounded grid,

but apply normal bias and screen power. The result is much higher power gain than in grounded grid. I would guess that in class AB2 about 20 watts drive will give 650 watts output with two tubes. (2500 Vp and 750 Vg2). This is extracted from modulator service ratings.

James, you are trying to do things the hard way.

There's not the slightest need for the tuner to measure such things as reflection coefficients and their angles. The electric motors driving a pair of variable capacitors don't have the foggiest idea what's on the other end of the drive shafts. One thing for certain, neither of the the variables will be a roller inductor whatever the motors imagine they are up to.

And neither variable will vary just phase or just magnitude. They will be operating simulataneously - both varying magnitude AND phase shift of the network's transfer function. Its usually a T-network with the central component down to ground being an inductance which changes only from one band to another. The other two components are usually a air of motor-driven capacitors. Circuit switching is done by relays. The Tx power MUST be turned down automatically to a few watts while the auto-tuning process is underway.

Somewhere in the circuit there is usually a pair of SWR bridges. Instead of the bridge outputs driving SWR meters they are applied to phase and amplitude-discriminating analogue circuits. There's usually little digital circuitry. And nothing which computes L and C values.

The best way to find how its done is to study the circuit diagram of a tuner which can be fouind in mainenance manuals. Until you understand how it's done you won't get very far with designing one for yourself.

Put the proposed tuner into YOUR position and ask yourself precisely what you are doing turning that pair of fron-panel knobs while watching the SWR meter. The cover is on the ATU box and you don'r know what's on the other end of the 1/4" drive shafts. One thing for certain you are not performing calculations with reflection coefficients.

I hope this has put you on to a more simple and profitable track.

The main reason is that there are several QRP mailing lists which perform a
similar function,
and tend to have a better 'signal to noise ratio' than newsgroups.

An example is the VK-ZL QRP mailing list for QRPers in Australia and New
Zealand
(see http://www.alphalink.com.au/~parkerp/qrp.htm).

My view is that Glen Ross' comment, while theoretically correct, is way too optimistic in real world terms.
Yes, it is possible to get a bit more than 3 dB gain by stacking identical antennas at large spacing, but the effective bandwidth will be narrow. In practice, one might get about 2.7 dB net gain in stacking 2 as against 1 antenna but as one adds more antennas to the array, the stacking distance grows and becomes more critical and the system losses accumulate quite quickly, such that net gains fall towards 2 dB and lower. The comment by Leonard Davis referred to a specific case of stacking high gain systems and is probably nearer the truth (perhaps a little pessimistic). There is certainly a point of diminishing returns and for moderate length yagis that point is at about 8 or 16 antennas in the array (for long yagis, the optimum is perhaps 4 to 8).

Glad ya asked Andrew.......nullifying needs only complacency and lethargy.......the "real" <chuckling> DANGER is getting interested in whats behind those dastardly panels!!! Next thing you know....you WILL become an addict....just......like the REST of us!

On the more serious side, just in case your humor bone wasn't hit, the DANGER alluded to is typically things "like" shock hazard to your ownself from contacting significant voltage points (remember WHY you were told not to stick those fingers in the wall outlet?). Not really knowing what type of equipment you were looking at, the gamut of DANGER warnings could range to microwave radiation or even mechanical injury due to flying springs etc (like I said....not sure what you were looking at).

Keep inquisitive - its a GOOD thing.

Gord

I bought a used, Tripplett 631 vtvm - vom at a hamfest and while inspecting the internals discovered a cooked-beyond-recognition precision resistor cradled into a groove at the bakelite function-switch with a slot number of "15". In fact, the resistor is a combo. value that has been replaced once. If this is possibly a regular happening on this meter, would anybody out there know what value resistor this should be, or have a schematic to tell? Thanks, Ed W.....K3FDY....

Antenna gain G is k * D, in which k is the efficiency and D is the
directivity. The splitter losses reduce the efficiency k, so (1-k)
part of the transmitter power is converted to heat, the rest (k) is
radiated somewhere.

Directivity D is the ratio between the main lobe radiation to
isotropic radiation. For a clean single lobe pattern this is quite
simple, but usually, when stacking several antennas, there are usually
quite strong minor lobes in various directions, eating up the
radiation from the main lobe, thus the stacking gain would be less
than 3 dB, even without splitter losses.

One way to get some idea of the antenna directivity is to measure the
main lobe width (at -3 dB points) both horizontally and vertically.
However, if the antenna system has large side lobes, they take
radiation out of the main lobe and the main lobe would be narrower
than with a similar antenna with a clean pattern and it would appear
that the directivity is greater for the antenna with multiple minor
lobes.

By stacking two antennas at a larger distance than optimal will create
a pattern with a lot of "fingers" and the main lobe is quite narrow.
If you just measure the main lobe width, you might incorrectly
conclude that the stacking gain is over 3 dB :-).

Paul

I agree with most of the above, but must take exception to the last
sentence. If the main lobe measurement shows >3dB then you have >3dB

gain. Gain in the directional antenna sense is a
maximum_radiation_direction parameter.

Hello:

I am not entirely enthused about the current batch of
Semiconductor Cross References. It seems they drop out-of-production
transistors from the cross leaving me with no follow on or specs to find a
suitable substitute.

Case in point, the MRF475 and MRF476. These were very popular items for
their time. Circuit diagrams from that era exist today and are published
today. The SCRL 5.0 that I tried to use doesn't even contain the references
to the
MRF series that I am interested in.

Does anyone have a "next to sure fire" method of finding
transistor characteristics/specs that are acceptable? OR, better yet, how
about a resource that contains all of the old stuff? Am I being
unreasonable?

This is going into semantics.

Directivity is usually defined as radiation angle of an isotropic
radiator (4 pi square radians) divided with the main lobe size
(expressed in square radians). Now everything is fine, as long as the
minor lobes are more than 15 dB below the main lobe. This is the
directivity over isotropic.

Now, assuming there are strong minor lobes eating up some (say 20 %)
of the isotropic power that could radiate. You can measure the main
lobe beam width and get a gain figure of > 3dB over something, but it
is definitely not over isotropic (or over single antenna in this case)
but over something that is less (- 1dB) than the original reference.
If you measure the field strength at a large distance (several
wavelengths) at the centre line, the field strength is up only by > 2
dB, since 20 % of the power was eaten up by the side lobes. As I said,
this is semantics and you have to be very careful about the reference
level.

Strewth

I thought most of the guys on this reflector were lucky to tye up their shoe laces, finally we get some serious aswers to a query

trent vk4ti

Ps What is relevant is the desired result: that being what are you trying to acheive from stacking, if the optimum you are after is 15 degrees radiation then 3/8 stacking distance is probably fine. Refer to the articles in the most recent ARRL antenna handbok or subscribe to TOWERTALK reflector and get some real answers o your real world question..

I agree with this last statement...furthermore, in "real world"
practice,
the gain from a large vertical stack is not very useful on HF because
it's
concentrated in a very narrow low-angle lobe which is generally not too
useful. I have a stack of three 6 element monobanders on 10 meters and
find that all 3 is seldom the best choice. Usually either the bottom 2
or top 2 will beat all 3 together. If you have access to N6BV's Terrain
Analysis software in ARRL's Antenna Book (18th edition), it is very easy
to see this as he shows antenna takeoff angles plotted against signal
arrival angles to different areas of the world. Of course if you had a
case
of measuring the antennas on a test range, the largest stack would
always
win...it just happens to be at a takeoff angle that is not very useful
in
the real world.

As another poster has confirmed, it is possible to obtain more than 3dbd by stacking two identical aerials. Another point to bear in mind in my original post was that I made reference to a "rule of thumb" for calculating gain. As can be shown, this is not an accurate figure in most cases but, in any aerial system that the average amateur is likely to erect, it will give a close approximation to the true figure. There are not that many people around who can install 16 times 11 ele yagis on 50Mhz <GG>

I'm trying to replace a triac in my Astron power supply. The supply conked out completely while I was trying to get rid of some high SWR during transmit. No fuses blew. I think I narrowed the problem down to a blown triac.

The schematic says that it is a 2N681. The triac I took out is in a flat package with the pins "C A G' from left to right with the manufacturer's marking SO535W. The triac I found in my spare parts bin that is marked as a 2N681 is in a round package with a 3/16 or so thread. I'm assuming that the threaded portion is the anode. Am I correct?

The reason I ask is that replacing the triac did not restore full power to the supply, only 11.75 volts which drops to zero under a very light load Therefore I either wired it in backwards or the spare triac is also not working.

Does anyone have the pinout diagram for this triac? Am I using the right triac or perhaps Astron threw me a curve. I'd like to be sure that I'm doing this right.

Thanks for any help,

Myron, W2EDY

I'm glad you're getting a schematic. I've sometimes been able to replace a
burned
resistor in a VOM by noting all resistor values in sequence. There is a
pattern to them, and often the burned one can be determined from that. Of
course, schematic is the best way.

Are you sure it's a triac? It sounds more like an SCR (Silicon
Controlled Rectifier), especially with the labeling that says "C A
G", which would mean Cathode, Anode, Gate.

What model Astron are you working on? I've seen the schematics for
quite a few, and I don't remember any with a triac in them. The
ones I remember (fuzzy memory warning on!) use a SCR as the
"crowbar" element in an over-voltage protection circuit. I think
that the ones I remember typically use a transformer with a
full-wave rectifier feeding a series pass style regulator. The
overvoltage protection feature was to save damage to equipment in
case the series pass regulator shorted.

Dave

P.S. Standard Disclaimer: I work for them, but I don't speak for them.

Hello--
IIRC, the 2N681 is an SCR and not a triac-- Peak forward blocking voltage = 25V
(kinda light for the application), RMS forward current = 25 A max., the anode is the
stud, the cathode the larger soldering-lug terminal and the gate the smaller terminal.

If this is used as a shunt overvoltage-protection device and not a regulator (i.e., if it's
a regulator it'll probably be mounted on a heat sink), the Zener diode that sets its
trip point may be defective (it's probably a 13-volt device-- the sum of the Zener voltage
plus the gate forward voltage-- approx. 1.2 to 1.5V-- will set the SCR's switch-on
voltage.

if you need full specs, I'll look further; I may even have a couple here... somewhere.
73,
Brad AA1IP

Dave,
Seeing as one of the groups that you posted to is "...homebrew", I'll stick my neck out and say that they are real easy to build if you can settle for response up to about 1.5 GHz.

The availability of small 49.9 Ohm 1% surface mount resistors makes it easy. The tricky bit is the balun. I have got about 35 dB directivity, below that it gets really hard to measure, also you'd be amazed how much nominal 50 Ohm loads vary. The best balun construction that I have found is to use a short length of sub miniature semi-rigid coax with a load (12, I think) of ferrite beads over it, and here is the trick, a balancing length of plain wire with the same beads, from the bridge connection that has the coax inner connection, to ground at the output. I used teflon (PTFE, for any europeans:-) board with microstrips, an oblong box to fit, with N connectors on each wall, using an external standard load for flexibility.
That just about covers it.
73,
Dan AC6AO G3NCR

Thank you for your help. I was told last nite that the schematic has known errors and that the "triac" is a 2N6813. I'm going to call Astron's tech support and check on this. The supply is a very common one, the Astron RS-35. I now removed the 2N681 and unfortunately the supply is still not producing full voltage or amperage. I'm stumped. Nothing seems to be getting hot, so I don't think the supply is being loaded down or shorted. Maybe the regulator circuit? I replaced the 723. Nothing changed.

The local "ham equipment repair' shop is getting $100 an hour, so if I don't fix this myself, I'm buying a new supply. (maybe a switching supply?)

Anyone have any ideas?

I believe the balancing wire should run through the same beads in the
direction opposite to that of the coax. It provides a path for the
magnetizing current around the output load, rather than through it,
thus improving the balance at the low frequency end.

Including a little schematic.gif would be nice here. Anyone got
problems with that?

My old Motrola list says the 2N681 is a 50 amp 25 volt SCR. (The package
info doesn't make sense for this part). Use an ohmmeter, the gate-cathode
pair should look like a diode.

The S0535W is a Teccor part number for a 50 volt 35 amp SCR in
a TO-218X package. Try Digikey or Mouser for Teccor.

Hello--
Trace the leads emerging from the power transformer secondary winding to
therectifier diodes. Check the voltage at the diodes' output-- I'm not
familiar with the Astron design, but it could feature a four-diode (bridge)
rectifier or a two-diode (full-wave with center-tapped xfmr. secondary).

Check the voltage at the rectifier's output under no-load and loaded
conditions. It should run between 16 and 20 volts (guesstimate) to allow
some margin for the regulator circuitry.

If the voltage is low or sags dramatically, you could have a defective rectifier
diode.

Disconnect one lead from each diode and check each diode's front-to-back
resistance ratio. Depending on the multimeter you're using, you should
measure tens to hundreds of ohms in the forwrd direction and megohms
in the reverse direction.

If the rectifier diodes check OK, there's a problem in the regulator circuit.
Check the pass transistor(s) out of circuit if possible, and also check any
driver transistors between the uA723 and the pass transistors.

Other possibilities include an open current-sensing resistor (generally
it's a fraction of an ohm) or cold solder joints.

73,
Brad AA1IP

That's interesting. What's a good source for those resistors? I have an HP8503A S-parameter test set that doesn't meet its 40 dB return-loss specification on port 1. It only does about 30 dB at the higher (near 1 GHz) end. I'd given up hope on it, but maybe I can tweak it back into shape, after all. Guess I could always hand-pick units from a pile 10% resistors if that's the problem.

446. Help with an old radio?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-22 00:00:00 UTC
From: Brendan K Callahan <god@pcpartner.net>
Message-ID: <8iuj58$b8c$1@ins21.netins.net>
Source record: 59869

Another ham gave me an old tube transmitter, a Globe Electronics Scout Extra. It seems to have 80m - 6m capability, with AM/CW. It's a little dusty, and rusty, but underneath where the components are, seems just fine, and quite clean. The set however, did not come with any of the 7 tubes, nor anyway to identify which tubes it needs, or where they go. Can anyone give me some basic information about this radio? Wattage, how well it worked when they were new, (I believe it is Xtal controlled) etc.

I'd love to get this on air, and finally get some HF practice in, besides 1w qrp :)

Brendan K Callahan, K&#65533;EES

Andrew:

The coil and capacitor form a resonant circuit. There is a lot of info on resonance in the ARRL handbook, inculding a chart showing the resonant frequency of specific values of inductance and capacitance.

You want a resonant circuit in order to select a specific frequency, presumably with a station to be heard on it.

Without resonance and selectivity, you would hear all the nearby stations at the same time, instead of just one of them at a time.

You can build your own headphones or speakers but it's a lot of trouble and you won't have anything as good as you can buy for just a little money.

Basically you need a diaphragm such as a paper or plastic cone, with a coil wrapped around the center, and a magnet to put near it. The current in the coil causes a magnetic field that reacts with that of the magnet and makes the cone move, creating the sound.

Try North Country Radio, the authors Graf and Sheets. They've had
a couple of projects in Radio-Electronics/Electronics Now/Poptronics.
One, over 10 years ago used the UHF TV channels and got some pretty
stern letters, especially from an FCC field office. Their later one
was in the 70 cm. band, I think. They have a web site.

Novermber 1967 was a good month for Homebrewers. QST for that month carried a really cool article by VU2JN that described his HB solid state QRP AM/CW transmitter for 40 meters. Lots of ingenuity.

Rod Newkirk's "How's DX" column featured a picture of a HB rig built on two coffee cans, using 2 6U8As It had two watts out (AM or CW) on 80 and 160.

Rod also noted that W2MELs "World Institute of Home Brewers" would certify homebuilt (nonkit) amateur stations. Are any of you solder melters certified? How do we contact the World Institute?

73 de Bill N2CQR (not yet certified, but definitely eligible)

Okay, okay. You guys are pretty funny and I can take a joke.
Maybe I need to be more specific. What I wanted to know was, given
an elec. item (radio, TV,etc.) has been opened, what are the parts that
can be dangerous, how to identify them, and how to get rid of that shock
hazard so you could safely fish around for scroungable parts.

They are 2 ways for me to do this:
1. Stick my hands in a touch everything, if still standing assume all's ok.
2. Rely on you Elmers to educate me until I get hooked up with local Elmers.

I vote for number 2,

Andrew

458. Toatal Newbie (Impatient Questions) short

Newsgroup: rec.radio.amateur.homebrew

Greetings all,

The ARRL Handbook is a marvelous thing. If I read
(and comprehend) all of it I'll be one smart cookie. On the other
hand, I could go from Ohm's Law to radio mods and take 600+
pages to do it. So be patient with my impatientance and answer
a couple of quick questions:

1. Given a simple crystal radio build, What exactly do you need a coil for?
You know, the wire wrapped around the toilet paper roll ?

2. How would a capacitor help ? Selectivity? How?

3. Any thoughts on homebrew ear/head phones or speakers that avoid
buying comm'l made ones? In other words, the simplest sets don't use
amplifiers per se, they use pre-made special little earphones,etc. How
to fabricate same or similar?

BTW, I been to the best web sites and there is alot of useful info out there,
but all end up, " And once you've built it, go to Radio Shack and special
order the mouser earphones." Or, " then try to get some surplus old army
headphones." I want to know my options. Really would like to try this.

Thanks,

Andrew

My guess is the expensive Motorola RIB box that you need to interface between a radio and a PC is nothing more than a level converter. Anybody have information on this unit-- schematic, pinouts (and same for the cable)?

I need to program a couple of GR300 transceivers, and can't afford $150--250 just for the privilege. Help!

Dave W1DAY

461. Re: Want: to build Motorola RIB interface, cables

Hi Dave,

If you have a look on the Ham Mods section on my home page and then go to the Motorola GM300 page you will find a small interface that you can build for just a few dollars. It,s as you say a simple level converter using a MAX232. It will program your GR300 as that's based on a couple of mobile GM300 radio's.

The URL is http://personales.jet.es/colinlowe/index.htm

If you need a more sophisticated interface have a look on http://www.batlabs.com

73 de Colin

The interface will program your GR300 with no problems, I use mine on a GM300, GM350 and a GP300.

Midnight science (the crystal radio crowd) have a bunch of books on the subject,,, somewhere on their link pages I've seen a book or something on building your own headphones. It would be easier to use a 1n32 diode and store bought headphones to get everything working,,, then move back to a broken razorblade, carbon pencil and home made earphones. Might as well build the capacitors at the same time,,, easier than a headphone. Two pieces of flat brass sheet, some saran wrap. I've never done it with a crystal radio,,, but have done all sorts of goofy caps for antenna projects. Anyway,,, just bought a real live crystal holder and catwhisker, so am on the quest of total home built as well.

Ok,,, now I'm starting to act like an old guy ;-)

Long ago,,, late 50's or early 60's, I tried to build a one or two tube kit from the scout office,,, plastic case, 90 volt b battery. Seems like it even had a speaker. Never did get this one to run.

Any one have a better memory of this one? On or off list,,, I'd be interested, really would like to see the schematic, or if really lucky,,,a picture would be great!

Get into the habit of discharging any capacitor rated > 50V or so before removing it from a recently-powered-down circuit or handling its connections. You can play melt-the-screwdriver for kicks and grins, or you can keep a resistor of a few kilohms on hand to discharge capacitors the Nader Way.

Also watch out for CRTs. Their large second anodes can store enough of a static charge to make you jump and drop the tube when you're removing it.

That's about it, unless you're into sniffing the radioactive paint from R390 panel meters....

jm,

Thanks alot. I think I get the idea now. I knew there was
some danger, but wasn't sure how much of the warnings were
just the manufacturers' way of playing CYA.

BTW, did you say radioactive paint? My kids have asked
before about building a cloud chamber. I don't have any old watches
or smoke detectors,etc. Would this paint work do you think? And if
it would, what/where is/are the R390 panel meters? On any basic ol'
color TV, fer instance? I guess I'd try to scrape some off (if that's
possible)---- preferably without gloves and while eating McNuggets.
<grin>.

Glowingly Yours,

Andrew

Andrew,

There's no radioactive material required for a cloud chamber. A cloud chamber shows the tracks of cosmic rays that come from the sun. It could be used to show other energetic particles, but usually isn't. You might be thinking of a Spinthariscope, a small device you keep in the dark for many hours, then in the dark look through the viewer to see the streaks of particles from atomic collisions. Such devices use a pinch of radium or indium(?). I used to make them as a kid by collecting and scraping old radium dial clocks, but I wouldn't recommend it these days. They're probably still available from Edmund Scientific for a few bucks. Cloud chamber construction details can be found in any good library. They're not as fun as crystal sets, but darn close.

ATV is not illegal, I'm pretty sure.

You can buy an ATV transceiver from P.C. Electronics (http://www.hamtv.com/)
or you can build one from the series of QST articles in Oct/Nov/Dec 1996.

Brendan,

Welcome to the orange side! After you've picked up a few books (search on ebay for "radio book" or "radio handbook" and watch the listings roll by), the simplest piece of ham gear to build is probably a simple crystal-controlled transmitter. A good superhet receiver is a lot more difficult, but if you want to try a radio just like grandpa used to use, build a 1 or 2 tube regen. It won't be micro-controlled auto-everything, but it's darned near a spiritual experience to build and use one <g>. Later down the line you can tackle VFOs and good superhets. BTW, another fun and possibly useful piece of gear you can build right away is an audio amp. Oh, and you'll be needing a power supply for all this too -- one that delivers 250-300V will be good for both receivers (actually, a regen would be happier at 105V using a VR tube regulator) and small transmitters.

There's an email list for homebrew hamming with tubes. It's called "glowbugs" and you'd be quite welcome there. Come join us and I'm sure we can get a few tubes, parts and schematics sent your way.

Here's the glowbugs subscription info, from the rec.radio FAQ:

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

I found another Lowfer (160-190Khz) beacon transmitter on the web.
This time it includes a complete schematic, circuit board diagram,
and parts list. You can view it at:

http://home4.swipnet.se/~w-41522/lfbeacon/longwave.html

I'd like to have one of these built, as I am soldering iron
challenged. Please, serious inquires only. After viewing
the transmitter, please include costs or if you'd be willing
to trade for a Kenwood TS-530S, with MC-60 Desk Mic.

Ideally, I'd like to have someone modify the PIC to work as
a BPSK generator.

I don't know if I am in the right news group for this or not, but I
figured homebrew would be the best place to start. I
recently was given a couple of primestar satelite receivers along with the
dish. Primestar went out of business a while ago
and the whole setup is really useless for what it was intended for. Is
there anything that I can do to convert it for receiving
anything as far as ham purposes. I have no desire to get it back on
satelite tv or anything, but for ham radio purposes I thought
it might be useable. If anyone has ANY suggestions please let me know. You
can E-mail me at: scot@innocent.com
Thanks all.

Hello,

I am looking for information for designing power splitters. My
particular application is low frequency (13Mhz) so I should be able to
use a lumped component design. I am trying to design a 4 way splitter

Any one know how to design one or where I would find the information?

Thanks

A Wilkenson 2:1 power splitter is simple and provides about 20 to 30 dB of isolation between its outputs. To provide a 4:1 split, use one Wilkenson splitter to drive two other Wilkenson splitters. Insertion loss in each splitter will probably be about .5 dB.

At microwave frequencies, the 50 Ohm input path is split into two quarter wave long lines with characteristic impedance Z0= 70.7 Ohms. A 100 Ohm resistor connects between the two outputs.

So do this in lumped elements. Working backwards from the output, use a simple LC section to transform 50 Ohms to 100 Ohms for each arm. Then connect the two sections together so the paralleled input impedance is 50 Ohms. Connect the 100 Ohm isolating resistor between the 2 outputs.

Connect three 2:1 splitters to get your 4:1 split.

Don K.

Have not built that rcvr, but have used binaural audio filter built from QST article years ago. Properly setup, it is absolutely incredible. I think the one I used years ago was originally designed for blind operators. It truly helps your mind visualize the spectrum, and IMHO this is a feature that some new rigs should come with as an option or even standard equipment.

I lost track of mine a few years back during a period of non-activity, but it would without a doubt be in use today had that not been the case. I would love to find the original filter article and build another to use with my FT-840. On the other hand, I might just build the rcvr anyway for the fun of it.

Chris,

The answer to your question is that there are a lot of answers. The questions that feed the answers:

1) Do you need a 50 ohm match at all ports ?
2) Do you need isolation between ports?
3) Would selectivity be an advantage or disadvantage?
4) How well should the ports be balanced in phase and amplitude ?
5) How much can it cost and how big can it be (is either one an issue) ?
6) Are we talking power. Power or POWER by any chance ?

At one extreme you have a splitter that just ties the lines together (don't laugh, it's been done ...). The match is not so hot, and the isolation is worse. It's balance is good, it's cheap and it's broadband.

If you buy a Minicircuits part open you will find four transformers in it. Three are center tapped equal ratio parts with 100 ohm resistors on them. They function as two to one splitters. You cascade them to get a four way split. The fourth transformer takes the low impedance at the input to the four way splitter you just made and gets it back to 50 ohms more or less. Depending on the cores this is a couple of decade bandwidth part.

The other route if your bandwidth requirements are not as severe is a lumped LC splitter. A pair of L networks are one possible implementation. A high pass L goes to one load and a lowpass L goes to the other load. As the filters get more complex you can improve things like match and balance. Almost any rf oriented network analysis program will do a pretty good job on these.

A whole other way to go is with 6 db splitters. Cascading two for a four way split will give you 12 db of loss instead of 6 db for the four way split. One example of a 6 db splitter is a set of three 50 ohm resistors. One each is hooked between the source and each load. The third one goes between the loads. Cheap very broadband excellent balance and poor isolation. There are also transformer based variations if you need > 50 db of isolation.

Depending on which way you go there are references that get into more detail.

Hope this helps

Bob

If all you want to do is transmit 1 channel at a time over reletively short distances, yes it can be done. If you want to be able to transmit all the channels at once (so that you can channel surf) then realize it will take 1 radio transmitter and 1 reciever for each channel. Unless you remote control the transmitter to surf for the tv. 100 miles is possible with ham radio equipment but the content would be illegal to rebroadcast. It is illegal for hams to rebroadcast another wireless service's content (except for space content like the shuttle).
Years ago our local repeater played a recording of a ham news bulletin that originally went out over some radio station. It was illegal to record it off the air and retransmit it, but was legal to phone up the source of the program, record it over the phone and then play that recording.

You will find that a cable tv franchise will be more than happy to go to court to shut down someone pirating their signal. And a 6mhz wide video signal is easy to trace.
It would possibly be cheaper to put in a sat downlink antenna at the remote site and just pay for sat programming.

The same sort of problem crops up when someone wants to use a wireless lan to connect their house to the t-1 at the office so they can surf from home for free. Here it is a little less illegal, unless the content itself is illegal in which case it could get you in big trouble.
thanks, John.

I doubt that you used as many tubes as Eniac did! If I recall some of those computers used between 10,000 to 100,000 tubes! With that many, the predicted failure rate would have been so high that they couldn't complete a single caculation without loosing at least one tube. They had to have someone walking in the computer constantly changing tubes! There was an article about this in Wired Magazine a few months ago. Interresting stuff.

493. Re: 6SN7 Failure

With the large number of tubes used a certain number of failures
should be expected.

They also had a problem with "sleeping sickness". The 6SN7 was a dual
triode
and when used in a flip flop circuit one triode was turned off. If the
tube
sat in that condition for a while (don't know how long) the cathode of
the
turned off tube lost emission. After much research they came up with
a better cathode material to fix that problem.

You know, there are frequent stories about the Eniac having lots
of tube failures, making the thing unreliable.

Somehow, I have used a lot of those tube in similar situations in my
life, and we ran them on 5 volts. Never saw one fail, get weak, or
anything of the sort. 24hrs a day, year after year service.

I wonder of those fellas ran them on higher voltage? Of course we used

the premium tubes most of the time.

Just curious

If they had used Fetrons instead of 6SN7's, Eckert and Mauchley would
have founded Microsoft in 1950, instead of us waiting for those two dweebs
Allen and Gates to do so. As a consequence, I would have been able to
understand C++ by now(!) and most of the bugs in Windoze would have been
found(if not fixed).

Bob,

Thanks for your response, here are some of the answers to the questions
you raise:

1. 50 ohms at all ports is required
2. Isolation would be nice, but I don't have a spec on it yet.
3. Don't have a spec on selectivity yet either
4. Phase and amplitude match are not critical
5. If I design my own, it should be considerably less than a Minicircuits
part. Size is small ~3sq.in..
6. Very low power: 7dbm input.

Where would I find the references you refer to?

Thanks,

Chris

<nod>
I just got a Globe Electronics Scout Extra for free--needs tubes, and a
schematic (since the tube "slots" aren't marked at all).
I have a AM/FM 7 tube radio--I was going to look into converting that to
cover 80m-6m (to match the Scout Extra). On a side note, I just got back
from field day, and made my first CW QSOs :) (on the air as N�RKX/3A/IA)

> There's an email list for homebrew hamming with tubes. It's called

> we can get a few tubes, parts and schematics sent your way.

<nods again> Will do!

I was thinking of maybe a first project of just a VFO for the Scout--seeing
as I only have one 80m Xtal. (That is, after I get it running!)

thanks, Brendan K�EES

I'm not joking - get a biro and draw on a piece of paper the symbols
for a coil and a capacitor. Include the terminals for connection to
transmitter or receiver, and to the atenna or feedline. Connect with
wire all possible reasonable combinations of coil, capacitor and
terminals (there's not very many) and you will have a complete set of
ATU circuits from which to choose.

Chris,

Probably the best alternative is a set of three two way resistive splitters each made out of three surface mount resistors. Fifty ohm resistors go between the source and each of the loads. A third resistor goes between the two loads. You hook your source to one splitter and then the other two splitters to the first one.

You can't beat the price. Bandwidth, balance, and match will all be excellent. Isolation (6 to 12 db) and loss (12 vs 6 db) are the drawbacks.

Hope this helps

Bob

Motorola has a old app note on this. Go to mot-sps.com and search
for AN-749. They will have to fax it to you. Fig. 8b has a transformer
circuit. Try 4 turns w/ center tap, 28 or 30 AWG on a Ferronics 11-081-J
core
for each transformer.

As far as the solid state option goes, one of our local hams (former radio service provider) mentioned once that quite a few no-tune hf solid state amps would work fine on 6. If you can find a cb'er with one get it away from him and back in ham hands. Those are often equipped with a low input setting which would match your six watt drive well.

As far as working with 6 watts goes, several years ago we had a radio at field day that put out 8 watts. Using a 3el beam we were able to work all over the western US from TX. When six is open you can do wonders with low power.
thanks, John.

Heck no. They'd still be finding fatal bugs in Windows 65.

I can't find anything that tells me how a synchronous demodulator would
even detect SSB, much less select which sideband. Explanations appreciated.

I believe that when sideband selection in mentioned in connection with a synchronous detector, they are not talking about reception of SSB transmissions but rather reception of normal (or reduced carrier) AM transmissions. There must be some carrier to synchronize to. The ability to select which sideband to listen to allows one to select the one with the least interference.

Irving Gottlieb's book "Practical RF Power Design Techniques" describes how to design power splitters, and talks about 2 way vs. n way, transformers, transmission line splitters, etc. The book is a little stale, he's pretty hung up on how great tubes were, in spite of being mostly about transistor circuits, but generally pretty good.

The book is pretty reasonable at Amazon, in the $20 neighborhood if I recall.

Dennis,

Just take the voltage off one side of the high voltage winding of the transformer you are using for the plate and screen supply. Usa a 1N4007 or similar diode and feed the AC into the Cathode so that you get a negative voltage out. With the proper voltage divider and filtering you will be in business.

I think it great that you are interested in building. It seems that this is becoming increasingly rare these days. The 6146 will give you an easy 50 watts out on six meters.

I am trying to design a 6 meter linear. 6W is really tough to compete with. I settled on using 6146, several people have recommended this and I have received no comments on a solid state option. My current stumbling block is the -50V 1st Grid bias supply. Most of the time the grid bias is set the floating the cathode above ground. But 50V is a bit much. Kenwood uses a separate bias supply and I believe Heathkit does also. If I had a 12V filament supply I could use a voltage quadrupler, but the the supply is 6.3V and X8 is a bit much. I would like to not install a second transformer for this. Has anyone used a DC-DC converter (5V to 50V) to obtain a bias reference. This would be similar to Kenwood generating 28V in the TS-700's for the finals.

Many thanks in advance.

A single 6146 is a little shy of what you are looking for in power. I would suggest a pair, which should give you some margin. You can make up the bias supply several ways. One method might be to take it from the plate supply transformer AC winding by coupling to the diodes through some small value capacitors. Work like resistors but with less heat. Another method might be to use a cheap RS 12V filament transformer backwards wired to the 6V filaments. That would give you about 55 VAC out, which you rectify, filter, and voltage divide. I'd suggest a zener for a regulator. You will also probably need some neutralization at 50Mhz. One trick I used to use was to incompletely bypass the bottom end of the grid coil, that is, use a 470pf capacitor and an RF choke. I'd then drill a hole about 1/4" away from where the outside envelope of the 6146 would fall, put a rubber grommet in it, and run a piece of stiff bare wire from the junction of the 470pf and RFC up through the grommet and parallel to the plate. Insulate the portion below the chassis with tubing if necessary. Trim the wire and/or position it for proper neutralization. It's actually simpler than it sounds.

I don't have the issue handy, not even sure if I have it, but this sounds like something that is long gone, if it even existed at all.

The DX column in QST used to be fun to read even for non-DX'ers. There'd often be commentary on amateur radio in general. There were the Jeeves cartoons, and made up dialogue about ham things. I can remember mention of a "Grommethead Schultz", circa 1971 or so, but I can't remember if he was a recurring character.

Considering you saw this in the DX column, I suspect it may have been something made up, for the sake of making commentary on something.

Even if the "World Institute of Home Brewers" was real, I sure don't recall coming across it in reading back issues of the ham magazines. So I suspect it never went very far, and considering that's over thirty years zgo, it must certainly be long gone.

I'm not sure if VU2JN is who I'm specifically remembering, but there was a time when there were quite a few articles in the ham magazines from Indian hams. They had severe restrictions on importing parts and equipment, and had to do a lot of scrounging and making do. They were interesting articles because they were informative on that level, when a lot of North American hams were just writing articles that were a rehash of previous articles.

In article <3957C449.342DFD24@clifto.com>, "Clifton T. Sharp Jr." <clifto@clifto.com> wrote:

> I can't find anything that tells me how a synchronous demodulator would
> even detect SSB, much less select which sideband. Explanations appreciated.
>
There have been plenty of detectors described over the years that have been labelled ":synchronous detectors". Since they use different schemes, some work better than others, and in some cases a given design is not in fact considered "synchronous".

The basic idea is to replace a missing or weak carrier on an DSB with carrier or DSB with suppressed carrier signal. At it's basic, it is identical to a product detector and BFO, in that you need to generate a local carrier, and convert the incoming signal down to audio in a mixer.

But of course, if the original carrier is there but weakened, turning on a BFO means there will be a beat with the carrier.

And if you have a real DSBsc signal, the inserted carrier has to be right in the exact middle between the two sidebands, or else you get a jumbled mess. (Both sidebands contain identical information, and when converted to audio when the BFO is in the exact place, the audio will balance out from both sidebands. But if the carrier is off, the sidebands will not convert to the same audio frequencies, and thus there will be audio beats between the information in the two sidebands.)

The earliest schemes simply amplified the weak carrier in order to get it strong enough to properly demodulate the AM signal.

Other schemes lock the local BFO to the incoming carrier, but as has been mentioned, if there's no carrier that won't work.

The simplest synchronous detectors that work with DSBsc lock to the difference between the two sidebands.

The most complicated, and probably best, synchronous detectors work along the lines of SSB detectors using phasing. These have two product detectors, with the IF signal feeding both and a BFO feeding the other inputs, but with a 90 degree shift between both, and then the resulting audio is put through an audio phase shift network, and then into a summing network. Through proper switching, you can select upper or lower sideband. I'm not going into an explanation of how that works, but it is covered in old SSB books, and in recent editions of the ARRL Handbook. Paul Breed described one such receiver a few years back, and the popular

R2 receiver from QST, reprinted in QRP Power and I think some ARRL Handbooks, uses the scheme and may be the most accessible explanation of the phasing method.

By adding a phase detector that has it's inputs fed from the outputs of the two product detectors, you can lock the BFO to the incoming signal, right between the two sidebands, and thus place that BFO in just the right place.

Note in all of these cases, the beat signal is either derived from the incoming signal, or is a local oscillator locked to the incoming signal in some way, hence the "synchronous" in the name.

Since there is no such way to place the BFO from a single sideband, there can be no synchronous operation. Of course, you don't need to do this anyway, since there is neither a weak carrier (if there was a partial or complete carrier, you'd somehow lock the BFO to it) as in an AM signal, or the need to place the local carrier exactly halfway between the sidebands (with an single sideband signal, if you mistune the local carrier, things will sound funny, but you won't have the two sidebands beating together). And in fact, one scheme for demodulating a DSBsc signal calls for using a single sideband receiver, with a filter that passes only one sideband, to turn the DSBsc signal into an SSB signal, at which point the product detector treats it like any SSB signal (and the same scheme can be used to demodulate an AM signal with an SSB signal, since the filter takes out the other sideband and attenuates the carrier usually enough that it is irrelevant).

But since a synchronous detector using the phasing scheme is identical to a phasing SSB detector except for locking the BFO to the sidebands, one can use the same detector for selectable sideband SSB detection merely by opening the loop between the phase detector and the BFO.

I don't know if the phasing scheme was actually popular, but you'd see articles about it often enough years ago, because it not only was a means of adding a product detector to an existing receiver that didn't have one, but it would reject the opposite sideband to some extent, which is a bonus when you're talking about receivers without really good IF filters, as were often seen before SSB became common.

I assume the popular receivers with synchronous detectors have them for the sake of better reception. And the better receivers offer synchronous detectors with selectable sideband. Once that is in place, the scheme allows them to add selectable sideband SSB at the cost of a switch. And then you get better SSB reception than the relatively wide IF bandwidth would otherwise allow; the only better shceme would be an SSB-wdith filter, and consumer receivers are unlikely to go to that expense.

In general, it is a Real Bad idea to play with radioactive
materials, especially when uncontained. Don't even think about
opening the packet from a smoke alarm. Uncontained Americium is
seriously bad news.

While some old glow in the dark panel meters and even watches were
painted with radium containing paints, they are relatively rare and
hard to find now, in addition to being somewhat valuable to
collectors in their undamaged state. In any case, it would be a
seriously Real Bad idea to try to scrape the paint off. Plus, if
you tried ripping a meter out of an R390, there are some R390
users/collectors who would probably get real upset.

Television sets should not contain any radioactive materials. They
can produce x-rays, but this is due to the high voltages used in
accelerating the electrons used in the CRT, and even these x-rays
are rather soft (30KV or less).

There are a couple of sources of radioactive materials that people
don't usually consider. Some glassware was made with Uranium salts.
Potassium Chloride, which is available from your local grocery store

as a salt substitute, may have a not insignificant amount of the K-40 isotope of Potassium, which is a rather strong beta emitter (if my memory is correct). Thorium has been used to coat cathodes in vaccum tubes (although beware of other harmful stuff in there), but is probably more readily available in mantles for gas lanterns. I've even seen some glow in the dark signs using Tritium.

Of course, you'll have to do some research to see what kind of particles you want and how much activity you want. But, more importantly, consider how you plan to dispose of the material. You shouldn't just plan to throw it 'away'.

Dave

P.S. Standard Disclaimer: I work for them, but I don't speak for them.

Source record: 59713

Greetings,

Just would like to know, Are there schem. anywhere out
there for building a small amp. that could be used in a crystal radio
set to boost output to headphones/earphones? The idea, of course,
is avoid batteries and other "external" power sources since in my
view true crystal radios shouldn't need them. I realize that I'm a total
newbie and it might be too advanced for me at this point, but I'd still
like to know. BTW, I finnaly broke down and bought the Radio
Shack "Crystal Radio Kit" to get an earphone I could use. Now I plan
to build my own from scratch crystal radio and then I'm going to try my
hand at a "fox-hole" radio as I think it's neat to make even a little
something when it's built from almost nothing. Fun to me!

Thanks to all,

Andrew

P.S. Thanks also to those who pointed me to e-bay. There's a wealth
of stuff there and I could see how a beginner (with guidance) could
put a small shack together without spending an arm and a leg.

Oh, sorry. A R390 is a wonderful radio receiver, filled with vaccum
tubes, from the early 1950s or there abouts. It's pretty huge,
having been designed to fit in a 19 inch rack mount, and taking up
about 12 inches of height and about the same depth, and weighing
roughly about 60 pounds (This is from memory from 20 years ago, so
the numbers may not be exact.). They have all sorts of dials and
meters on them. The one I actually used was a R390A, which would
receive AM, CW, and SSB from 30 MHz down to 0 Hz (You could
even listen to the 60Hz power lines, but it was pretty dull.).
They're wonderful radios, especially given the fact that they're
about 50 years old. Unfortunately, even at 50 years of age, they
still command a premium price (about $500-1000?).

Dave

P.S. Standard Disclaimer: I work for them, but I don't speak for
them.

Hi Cliff,
Sync detectors are not made for SSB- they are an AM detector that gives better fidelity during conditions of selective fading. An internally generated, phase locked carrier is substituted for the incoming carrier. Better sync detectors allow you to choose to lock onto the USB, LSB or carrier of the AM signal
Although it is possible to listen to SSB with a sync detector, there is a lot of phase noise as the PLL searches for lock..

Hi Andrew..it is possible to build such a circuit..you can use the small D.C. voltage that is developed on the output side of the diode to run a low voltage audio amplifier circuit.
I am sending a bitmap picture of an example schematic I drew up for you via email. The connection marked B+ should go to the DC input on the amplifier and the connection marked AF goes to the audio input on the amplfier. The component marked L represents an audio choke..that will allow the DC generated by the diode rectifying the carrier of the radio station to pass through, but will prevent the audio from being attenuated. You can probably find some kind of low voltage audio amp intergrated circuit at Radio Shack or somewhere like that . The audio choke L can be derived from pulling the audio output transformer from a junk transistor radio and using the primary winding side for the choke. C1 in the schematic can be a .01 mfd ceramic capacitor..it's function is to block the carrier DC and allow the audio to pass through.
C2 can be a 1000 mfd electrolytic capacitor..it's function is to help regulate the DC voltage to the amp.
If the amplifier requires a negative voltage DC input, then just reverse the Diode and C2 polarity, and the circuit will provide negative voltage.
The results of the circuit will vary, depending on the voltage requirements of amplifer you get and signal strength of the radio station. Use a nice long antenna and a very good ground connection..say 100 or more feet for the antenna and cold water pipe connection for the ground.

Have fun Experimenting! :-)

Mike N3HJQ

The R390 (and R390A) is a piece of crap - was when they were
first sent to sea in the 50's, and still are today.

They receive down to 500KHz (not 0Hz), and cannot be used on SSB
without a converter (or homebrew product detector conversion).

All the "cult" of current collectors must never have had to use
them on a destroyer!

550. Beware of Dick Burke

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-27 00:00:00 UTC
From: richcom@earthlink.net
Message-ID: <396036a6.13265451@news.earthlink.net>
Source record: 59723

He goes under two emails: n1rsp@qsl.net & toby@gis.net

I replied to a post regarding two laptops. Dick told me they had two batteries and no power cords. He told me they did not have built in mouses but would supply a mouse for one. I said fine for $85. He would only accept Cashier's Check. Everything was his way.

After my cc was in the mail, he emails me the next day, Sunday, telling me, oops, sorry only one battery. But I'm throwing in the mouse. Well, the mouse was already in the original deal. So now for my money I'm only getting one battery where I was purchasing TWO.

Now it's not a deal anymore. So I quickly emailed him back and told him that I did not want the deal anymore and to please send back my cashiers check when it arrived.

To verify it, I phoned him on Monday, because NOW he's ignoring my emails. His wife rudely spoke to me and acted stupid. She didn't know where he was or when she would see him. That was the second hint that I was dealing with unscrupulous people.

What a pair! They deserve each other.

So I phoned again that evening and the phone was busy and still no emails.

The next day, he decides to tell me that my check was immediately deposited and my computers were in the mail. WOW, isn't that something, he takes my money and sends me what he wants, which is a lesser deal than agreed upon.

His emails became very foul and abusive. So I am now dealing with a trashy mouthed person. I'm out the $85 but I hope this is a warning to others before dealing with such garbage.

If anyone wants to see his nasty emails. Let me know, I'll send them to you.

I was a gentleman through the whole deal. Something that he can't say

about himself.

So BEWARE of trashy, crooked, lying DICK BURKE.

The moral of the story is: he misrepresented his items, took the money and ran!

He decided to change the deal and I am stuck with it. Is that fair to

anyone out there? You decide.

551. need 121.5 MHz notch filter or how-to build

Newsgroup: rec.radio.amateur.homebrew

Hi all

I'm having a problem with a radio installation interfering with a GPS installation. I have a 2-way radio that is transmitting a harmonic in the GPS signal range. This is being amplified and retransmitted by the front end of another radio, causing the GPS to drop out.

This second radio only needs to xmit on 121.5 MHz. I'd like to find or build a notch filter to only pass 121.5 MHz to put between this radio and its antenna.

Where do I find one or how do I build one?

Thanks

Dale Parfitt of Parr Electronics makes a great notch filter designed to address problems in the 2 meter band caused by pagers, and business band radios operating just above the 2 meter band.

I suspect that if you were to contact him it might be possible to have something made that will address your problem.

If you want small numbers of the common types, I'd go to Dan's Small Parts and Kits. He also has 3 different colors of magnet wire - an absolute must for making double balanced mixers. One big advantage of Dan's over Amidon or Palomar Engineers is that Dan's likely has other stuff you want to help make the shipping a little less painful. It's hard to find enough toroids to make the shipping worthwhile if all the place has is toroids. Dan's URL is http://www.fix.net/dans.html/

Hamfests are another good source, especially the better ones. But if you need an oddball, you're going to end up at Palomar or Amidon - no other choices other than sheer dumb luck at Mendelsonn's or BG Micro! These guys are always worth checking because they're cheap, but there's probably a 1% chance that they will have what you need.

If you are looking to only pass 121.5 then you are looking for a bandpass filter, not a notch filter. The Handbook has appropriate designs that can be scaled.

How do you make the 'cloud'?

I've put HCl (spirits of salts) near NH4OH (cloudy ammonia), and the
vapours mix to get an excellent fog.

You could then suck the air out of a glass tube (that has two end
elctrodes) and drive the tube with 10s-100s of kV DC from a stepped-up
tv output stage, and put the electron-bombarded end near the fog and
see what happens :) A geiger tube can detect the activity also.

You need a bandpass filter. Once you suppress the harmonics from the TX on 121.5, you might still find the fundamental overloads the GPS active antenna. If this is the case, you will need to relocate the GPS antenna far from the VHF antenna or buy an active GPS antenna with a preselector filter.

If it is your two way radio that is faulty, you should fix it and not try to cure any secondary effects caused by the harmonic radiation. A low pass filter between the radio and he antenna should do.

>This second radio only needs to xmit on 121.5 MHz. I'd like to find
>or build a notch filter to only pass 121.5 MHz to put between this

The 121.5 MHz is the international aviation emergency frequency and I would not tamper with such critical equipment, just in case if that filter would fail at a critical moment.

Anyway, what you are looking is a band pass, not notch filter.

567. how to make a 1:1 choke balun

I have an MFJ 901B tuner. While it does have a 4:1 voltage balun at its output, I want to try using a choke balun. I have seen these discussed on this group, but need references to contruction info for such a device for 40-10 meters, no more than 100W. Also, how is such a transformer connected to a T-network tuner, when the user wants to run ladderline from a dipole or loop to the tuner?

It's hard to go wrong with the $9 Amidon AB240 Balun Kit. Use the
included wire for a 1:1 Current Balun/Choke or you can simply wind
ten turns of small diameter coax around the toroid. I prefer RG-400.
Wire one side to a coax connector and the other side to banana
sockets. Put banana plugs on the ladder-line.

MUCH easier to find a low pass filter just above the aircraft VHF band.

Choke baluns are generally made by winding 8-10 turns of coax over a form about 6" in diameter. Some people just coil up about 8-10 turns of coax about 6" in diameter. Since they're used to "choke" off the RF on the shield of a coaxially-fed antenna, I don't think they're what you want.
Regards, Jim

I used to make air core baluns with the trifiler windings, but those have seem to fallen out of favor somewhat. But if you use the correct number of turns for the freq to be used I think they do ok. Don't really cost anything to make. Nothing to have to order. But, myself I lately prefer to use use the easiest 1:1 of them all. A few turns of coax wound into a choke. MK

I built a 1:1 balun once using a big ol' ferrite bar I dug out of a portable AM radio. That bar was about 9 inches long and almost three quarters of an inch thick. I close-wound some RG-58 coax the entire length, wrapped it up with electrical tape and it worked great..I used it to feed the ladderline of a homebrew half-sized G5RV antenna for 40-10 meters. The mast I put up consisted of two 10 foot lengths of 2inch diameter pvc pipe joined in the center..the ladderline and balun were run up inside the pipe. the pipe were capped off at the top, with a couple of holes drilled on each side for the dipole wires to come out..the wires sloped down to the roof like an inverted Vee. The pvc mast was guyed at the top by the dipole wires north and south and nylon ropes east and west, but I neglected to guy the mast in the center.Then one day a big wind came along and snapped mast in the middle and broke the bar..I was heart-broken!

martinw@one.net
shared these priceless pearls of wisdom:

->This second radio only needs to xmit on 121.5 MHz. I'd like to find
->or build a notch filter to only pass 121.5 MHz to put between this
->radio and its antenna.

I'm guessing here, but I'm guessing that your "second radio" is an ELT. If that is correct, two things:

One, the ELT transmits both the fundamental 121.5 *and* the second harmonic 243.0 at approximately the same power levels so that either civilian or military homers can find your sorry ass.

Two, why would you care about your GPS when the ELT is going off?

If my guess is wrong, post a little more about your actual problem so we don't have to guess answers.

Obtain a 2" outside diameter ferite ring. For 100 watts, 40m and upwards, wind on 6 or 7 turns of twin, figure of 8, flexible mult-strand, 18 or 16 gauge, speaker cable. Or something like that. Very non critical. And there you have it.

To include160m and 80m bands wind on 8 or 10 turns..

I have a few surplus air-variable capacitors that I'm trying to determine voltage ratings for. The plate spacing is very close, 0.01 inch or perhaps as much as 0.015 inch but no more than that (checked with a ruler graded in 100ths).

It's possible these were meant only for RX, but I'd like to use them for TX, in a tuner. Can I just figure the breakdown voltage of air @ STP?

I thought about just trying them to see if they arc (w/100W), but thought I'd make this post first before running a possibly destructive test.

I doubt those will hold up well with 100 Watts in a tuner. Often in a tuner, the voltage on a capacitor is greater than that on the line. At 100 Watts, 50 Ohms, 1:1 SWR, the voltage is about 71 Volts rms, or 100 Volts peak. Those capacitors should handle that much okay, but since it's a tuner I suspect you will be dealing with somewhat higher potentials.

OK at 100 watts for use in Pi-match or L-match networks provided they are used at the 50 ohm (Tx) end of the network.

100 watts into 50 ohms = 100 volts peak.

I just purchased a Federal Signal PA200 (siren and PA) for the purpose of providing an amplified signal from the radio(s) in my truck to a PA speaker on my truck (radio rebroadcast).

The unit has two jones cinch plugs one is a 8 pin and the other is six. The 8 pin one came with a wiring harness with 6 wires: red and black (power), two brown (external speaker, or audio from the radio?), one white (unknown), one green (unknown).

The second plug (six pin) has no wiring harness, so I have no ideas what so ever abou that one.

Any help on this would be appreciated.

Thanks,

584. Nokia/Mobira PMR/cellphone ham conversions

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-06-29 00:00:00 UTC
From: Gronlund Pentti <benjamin@ele.tut.fi>
Message-ID: <ycrr99gyzk2.fsf@ele.tut.fi>
Source record: 59557
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,uk.radio.amateur,alt.ham-radio.vhf-uhf,de.comm.ham, sfnet.harrastus.radio.ham

I hope that the headlines were competitive enough to raise your appetite. :-)

Nokia and Mobira are brands that are on sale everywhere. These are the recent cell phones, if you are looking for some 'warez' for them, too bad. Try again...:-)

However, Nokia/Mobira radios have been sold longer than there were any cellular networks, just like Motorola. And when the first NMT cellular networks emerged in the Nordic countries in 1981, there was a Mobira phone available. And, as you can confirm from many public sources, this is the way it has been ever since.

Most phones, starting from that era until the early 90's, have two attractive features when compared to the phones of today. They used a common single-chip CPU like RCA1802/1806, Hitachi HD6303 or Moto 68HC11, and the program was stored on a common DIL EPROM.

The standards we are talking about are NMT450 and NMT900. There is also some plain-vanilla and trunked 80/150/450 MHz equipment. Most of them are Nokia/Mobira, there are also some other Finnish brands like Benefon and Televa, and some Nokia PMR equipment is actually OEM stuff from companies like Kyodo and Philips. We also have links to some pages with conversion info for other European brands.

Well, we took a couple of these beasts, gave them the only treat-ment we know of, and you'll see the rest on our pages:

http://oh3tr.ele.tut.fi/english/modifications.html

The NMT phones have been used in all Nordic countries, Holland, Switzerland, Poland, the Czech Republic, Thailand, Malaysia and in many other countries. The trunked PMR phones have been exported to many European countries like Germany, Holland, Spain and the UK. You can even find them in the Azores or even in Sierra Leone.

The language of the pages has been chosen so that it is understood all over the world. This means bad English. The pages appear also in French, Italian and Spanish. If you think you can help in translating them to e.g. German or to some of the Scandinavian languages, please do not hesitate to contact us.

We are also looking for people who would like to write software and make modification notes for the early Nokia AMPS phones. There is a

possibility to supply a limited quantity of Nokia manuals to reliable third parties, they say ;-)

Remember to relax on the holidays...Wally, this means your retirement, too...:-)

While a ferite balum is small, It is subject to saturation at high power levels. A good 1:1 choke balun can be made by just winding some coax into a coil. This old trick was used to feed tri-band beams such as the Mosley TA-33. Just coil the last 10 feet or so of the feedline into a coil of about 9-12" in dia, for about 5-15 turns. Tape the coax into a coil and just connect the free ends to the balanced load. Sounds simple, but it works. The number of turns and the diameter of the coil depend on the type of coax and the operating frequency. RG8/U can't be coiled much tighter than 10" or so in dia without crushing the cable. RG8X/u or RG58/U can be wound into a tighter coil, say 6" dia. 5 turns is enough for 10 meters, might need as much as 20-25 turns on 160. Look in the ARRL handbook.

Doug:

You didn't say what frequency oscillator you wanted to make. There are audio frequency oscillators and radio frequency oscillators. They can be free running, crystal controlled, voltage controlled, etc.

I suggest you check you local library in the non-fiction section, around catalog numbers 620 or 621. There will probably be a large book of electrical circuits. It will have several chapters on oscillators. The library will probably have some ARRL publications like the Radio Amateur's Handbook, which also have chapters on oscillators.

You might also check the web. There are several websites that have circuit diagrams for oscillators. One good one to start with is: http://hem.passagen.se/sm0vpo/

The ring is not subjected to saturation at high power levels because
the two currents flowing in opposite directions and flux produced by
the two wires cancel each other out in the core.

Who want's a geat, extremely heavy, expensive hank of lossy coax
hanging from the centre of a dipole, dragging the antenna into a V and
bending the masts inwards to failure point ? Ugh !

My ferrite balun rings and rods run warm only in hot weather.

And what's the ARRL handbook ?

Subject: [sddxc] SB 1714 California PRB-1, your support is needed

There is a bill now in Committee in the California Legislature SB 1714 which at first was an attempt to have PRB-1 limited federal preemption codified in the California Government Code. A well organized opposition has stripped the language which would have precluded a city of County zoning regulation form regulating ham radio antenna below 75 feet.

Those opposing the bill are well organized, It is critical to the eventual passage of a ham radio friendly statute for the voice of all amateur radio operators, and their supporters, such as those agencies and groups which benefit ad support amateur emergency communications to write, E-mail and call their Assemblyperson to support the passage of SB 1714.

There are at least two ways to find out who your assemblymember and what there address is:

1. Look in the government pages of your local telephone book. There you will find the local office of the assemblymember. Call the local office, and ask for the assemblymember's Sacramento office address.

2. Look at the web page http://www.assembly.ca.gov, and follow the "Find My District" link on the left side of the page. It will ask you for your street address, and return the name and contact information for your assemblymember.

Brad Wyatt, retired ARRL Pacific Division Director, wrote a letter to his assemblymember and the Local government Committee, which ARRL Volunteer Counsel K6HS has modified slightly to make "generic" and which is a good example of what you might say to your assemblymember. In writing your letter, put it in your own words to the extent possible. Otherwise, use parts of it or just copy it.

Be sure to send a copy of your letter to the:

Assembly Local Government Committee
1020 N Street, Room 157

Sacramento, CA 95814.

Here is the letter:

****

Dear Assemblymember <your member>

Senate bill SB-1714 has passed the State Senate, and is now before the Assembly Local Government Committee.

I support this bill and am asking you to support and co-sponsor the bill. Antennas and towers are key to successful communications for the 103,000 Amateur Radio operators in the State of California who are proficiency tested and licensed by the Federal Communications Commission.

As you may know, some cities, towns, and counties have developed land use standards which are so restrictive as to literally prohibit Amateur Radio communication. This bill would be consistent with and complement FCC Regulations, Part 97.15, in requiring municipalities to accommodate Amateur Radio.

The importance of Amateur Radio to California and the rest of the country is expressed well in the FCC rules:

§97.1 Basis and purpose.

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.

(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

These objectives cannot be achieved if Amateurs are precluded from pursuing their avocation at home by local actions which impose significant application fees and restrictions which do not, as the federal regulations require, reasonably accommodate the Amateur Radio service.

Please support the enactment of SB-1714.

Very truly yours,

<your name>

cc: Assembly Local Government Committee

****

Please copy and forward this email to everyone you can think of who is
or should be supportative to Ham radio ops.

You can connect an SWR bridge between the exciter and the amp. Adjust the coils in the SB200 for the lowest SWR as seen at the exciter end, consistant with max grid current at the SB200. Should be a rather 'wide' setting as this is a low q circuit.

I don't remember if the original poster specified the application for the balum. I agree for the center of a dipole supported by the ends a coax balum might not be the best idea, but a proper dipole 50-70 feet in the air feed by RG8U AND a balum about the size an weight of a W2AU will still have a good amount of weight hanging from it! I have always put up dioples as inverted V's anyway since finding two tall supports in my back yard has always been a problem, and the tower supported my beam was available. The inverted V has the advantage of supporting the dipole AND the feedline. My current dipole IS supported by the ends, but feed with light weight open wire line.

The coax balum would work out fine in a matchbox, and I would put it BEFORE the network between the rig and the network. That way the balum only sees 50 ohms.

Hello,
Be careful if you have a radio with an
autotuner, while trying the swr meter
approach mentioned by another.
Turn off the autotuner, or it will continuously
try to tune while you tune.
BE CAREFUL IN THERE. YOU ARE
RIGHT NEXT TO THE TUBE SOCKETS.

The Grid Dip Meter, or MFJ 259/259B
meters are a good way to go. You need
to unplug the amp, use a resistor to
simulate a load for the tubes, and
manually close the t/r relay. Then dip
or attach the analyzer to the input.
Good luck.
Bennett ko2ok

From: Warren Williams <wgws1237@peganet.com>
Message-ID: <8jii4o$37g$1@andromeda.peganet.net>
Source record: 59573

Coils in the input section are not tunable. If one of the components in the input section is faulty, it should be manifest by viewing the SWR in the line between your H.F. exciter and the input to the SB200. If the SWR is high on each band, this would indicate trouble, either in the connection between the exciter and the SB200 or in the circuitry from the input connector to the band switch or the band switch itself.

If the SWR is high on just one band or several bands. It may be that the components in the input circuit or circuits is faulty.

Again, all components in the input circuits are fixed. You didn't mention why you wanted to "tweak the input circuit on my SB200". It may be that you don't have sufficient drive from your transceiver.

Hope this helps you!

Ken,

Make a rough random-wound hank of 14 or 16 turns of RG58, or of any other sort of thick insulated wire which might behave something like coax braid, roughly 9 to 12 inches in diameter, with the ends fairly close together. Use a couple of pieces of sticky tape to hold the turns in position long enough to make some impedance measurements between the ends of this ARRL handbook recommended choke coil.

Use your battery-operated MFJ or Autek, American-made* antenna analyser to search VERY SLOWLY from 1.5 to 30 or 40 MHz, looking for low impedance resonances. On a sheet of paper write down the approximate frequencies at which such resonances occur and record the measured low impedances at those frequencies. If you like, write down the values of the low impedances experienced at frequencies between the obvious resonances.

Ideally, produce a graph of impedance vs frequency from 1.5 to 60 MHz. It won't take long. These little boxes make life very easy. I would think a fair proportion of contributors to this newsgroup already have one.

Then ask yourself if you would connect THAT sort of heavy, expensive, component in the coaxial feedline to your favourite multiband HF antenna.

Then wind 6, 7 or 8 turns of wire on a 2" diameter, HF quality, ferrite ring and measure impedance vs frequency between the two ends of the winding.. Then ask yourself which particular sort of choke you prefer. If you detect any low impedance resonances at all please inform this newsgroup of your findings.

If anyone should state they have worked DX into the antipodes while using such great hanks of coax choke in the feedline then I don't doubt their word. After all said and done, ANY bloody thing will WORK.

* If it's made in the USA then, by definition, it MUST be right.

One way to solve problems like poor match between the exciter and linear amp
is to install a tuner between the exciter and amp. In an experiment I was
doing with a homebrew exciter and homebrew grounded-grid amp I connected an
MFJ antenna tuner (that small 200 watt no-frills model) between them and
tuned the tuner for maximum drive into the amp. Measuring the swr with a
meter between the exciter and tuner showed the maximum drive occured at
minimum SWR.

Only just.

There was a time when the design engineer would have been dragged
through the city's streets to the Tower of London where his neck would
have been laid on the block.

But now the Chief Executioner's Office has been abolished the country
has gone to the dogs.

Bring back the Axe !

I would like to build a 12 or 24v to 120v 60hz ac TRUE sinewave power inverter (about 500 to 1000 watts out). Ideas I am throwing around are : Crystal timebase, PIC controller/AD FET outputs. If anyone has schematics/info or can point me in direction of info, and/or has had experience with homebrew inverters would be very helpful.

thanx,
John Bald

Great place to start... Get a surplus UPS (Uninterruptible Power Supply) rated at the amperage to conform to your needs. Just pull the inverter & play as you like.

I have an Interstate F-77 function generator and a
Marconi TF 2015 RF generator for sale.

The F-77 provides sine, square, triangle and pulse
from 0.00002 Hz to 20 MHz (uncalibrated below
0.001 Hz). It offers continuous sweep, trigger sweep,
sweep and hold, and burst mode. Sweep is linear or
3 decade log.

The TF 2015 is a general purpose am/fm generator
covering 10 MHz to 520 MHz in 11 switched bands.
Levels are -127 dBm to -7 dBm. Attenuators give
11 steps of 10 dB plus 0 to 10 dB continuous.

Have copies of the manuals for both. Will take $190
for both.

Located in S.W. PA. Convenient to I-79, I-70, and I-43.

616. CENTRE LOADED DIPOLES

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-02 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <8jm5vs$ku4$1@neptunium.btinternet.com>
Source record: 59589

A new computer software program is now available::-

DESIGN & PERFORMANCE OF SHORT, CENTRE-LOADED DIPOLES

When antenna erection space is limited a dipole shorter than the optimum overall length of 1/2-wavelength can be induced to radiate efficiently by inserting a loading coil at its centre. Even at lengths as short as 1/20-wavelength on 160m and 80m very useful signal strengths can be radiated. An advantage of a central loading coil, which is frequently overlooked, is the fact that it can be coupled to a feedline of any impedance, open wire or coax, by adjusting the number of turns on a link winding wound over the centre of the loading coil.

PROGRAM INPUT DATA: Length of antenna wire or rod extending beyond ends of loading coil, wire diameter of the extension, length of loading coil former, diameter of loading coil former, height of antenna above ground, impedance of feedline from transmitter, type or conductivity of soil under the antenna, operating frequency MHz, ratio of loading coil wire diameter to winding pitch. Slinky's welcome.

OUTPUT DATA: Number of turns on loading coil, equivalent resistances of coil + antenna wire loss, ground induced loss and radiation resistance, coil wire gauge, coil winding pitch, length of wire on loading coil, overall radiating efficiency compared with full-size 1/2-wave dipole at a height of one wavelength.

WHAT IF?: There are facilties to continuously vary, from the keyboard, in small increments, five of the principal input parameters, while observing output data. Is your primary interest the number of turns and the length of the wire on the coil? Such information is available in milliseconds.

File size of program MIDLOAD is approximately an economical 50 Kilobytes.

Interested ? Download from my website in a few seconds and (not zipped up) run immediately.

617. Crystal Impedance Meter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-02 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <395EA8A2.D2241D1@tri.net>
Source record: 59590

I bought a RFL Industries Model 5950A Crystal Impedance Meter with RF Module 460A at a hamfest. Lights up, but the output of the oscillator seems stuck about 4 MHz and I didn't get a book. Looks like all the meters and stuff I want to characterize some crystals for filters, but inside are a bunch of DIP relays and some components securely covered with heat shrink. Probably can trace the circuits as it is all discrete component construction. Last calibrated in 1990 by the FAA.

Anyone have a schematic or info.

Thanks

N0UU

Hi,

I have just gotten my new website up that has schematics, board layouts, etc.
of my homebrew receiver.

http://members.aol.com/gapershi/radio/radio.htm

It covers from <300kHz to over 30MHz. AM and SSB modes.
Synthesized digital tuning with 1kHz resolution. BFO tuning for SSB.

I am not a Ham radio operator, but I enjoy listening on medium and shortwave
frequencies.

I have had a lot of fun designing, building and using this radio. I may be
continually tweaking the design as time goes by, but I think it is working
pretty well as it is now.

If you are someone that has an interest in building your own receivers, you may
find some helpful information by studying my design. If you are someone that
has a design of your own and would like to share it, I would be interested.
Maybe get some new ideas.

Here is my e-mail: Gapershi@aol.com

bye,
Gary Pershin

621. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8joe1n$5mn$1@news.hawaii.edu>
Source record: 59594
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

I had given some thought to utilizing the "Magic Sines" that Don Lancaster had several references in (not discontinued) one of his columns. He had worked out some sequences of off/on transitions that minimized transitions (lossy) and also harmonics. Looks to me like a PIC could toggle on and off an H bridge or such at an adequate s speed/rate to make a very clean source with little filtering needed. My application would be for 400 Hz and use one of the mil. fil. xfmrs that still rumple around. The other advantage of his "sines" is that you can control the output voltage by selection of the sequences..

Now, where do you get the 83 amps plus inefficiency?

Looking for you to publish your project.

Oh yes: July Circuit Cellar has a 20 watt version that uses a PIC. A starting point.

Watch hamfests for a Best Power Inc FerrUPS. The 700VA model is often
about $100. Uses a single 12V battery. Does exactly what you are
looking for, will even start w/o A/C present. Designed to run 24/7,
and runs continuously even when the mains power is present.

I just looked at the website. Neat design, some of your ideas are cool. I don't think I've ever seen fets used as variable bypass elements for emitter resistors to control AGC. The use of 2n2222 transistors in the IF seems a little 'quaint' though they do work well at 455khz, and they are cheap. I have quite a few CA3028A's so I probably would have used them in the cascade configuration with the third transistor used as a current robbing agc circuit. I think motorola has discontinued the PLL chip you used, though jameco may still stock them. I have been thinking of using a pll/dds combo to get a tuning step of 1hz (needed for SSB).
I also would have used a small micro to control the synth. circuit, but I can relate to those who don't want to have to program them. (Then again I have a small 8031 ice and lots of 8031 chips in the junk box!)

Where did you get the mini circuits vco chip? I havn't found a source for mini circuits in small quantity.

Nice looking circuit boards! Which cad package? Will you have actual size images in postscript? (Print to laser printer on transfer paper, iron on to copper clad boards and etch).

Please post some pictures of your receiver. That might get some of use off our butts and start soldering!

Please excuse the very late reply; I don't check this newsgroup often.

For years and years, it has been well known--or maybe not that well known after all--that Amidon is a reseller of Micrometals parts and that Amidon uses the Micrometals parts numbers for their powdered iron cores. If you need a specific Micrometals powdered iron, just go to Amidon and ask for the same part number. (This can be verified by comparing Amidon and Micrometals catalogs.)

Where did you get the mini circuits vco chip? I havn't found a source for mini
circuits in small quantity.>

Mini-Circuits will sell to you in small quantity, but you may have to pay a
little extra. My catalog states that the minimum order is $50. If you get a
couple of VCOs and a couple of the TFM-2 mixers that I use in the radio, you
won't be far from the fifty bucks already. Check out their web site at:
http://www.minicircuits.com
find the nearest distributor under the representative list. Give them a call
and see what kind of deal you can get.
Of course the reason that I used their VCO in the first place was because I was
too lazy to build my own. I see no reason why a person couldn't build their
own VCO and have it work just as well. Just make sure that it covers the
proper frequency range (24.576 to 49.150 MHz) and the required tune voltage is
no more than about 14 volts.

Getting actual size images has been a problem for me. You can get them if you
use an image editing program such as Paing Shop Pro. You can set the image
print size to whatever you need. I'll see about getting them in postscript
format.

Right now I don't have a digital camera or even a color scanner. The image that is on my web page is a scale drawing however, and shows what the radio looks like from the outside. I have built a wooden cabinet for the radio. I presume you want to see thi "inside" of the radio. I plan to do that someday, but I don't know when that will happen just yet.

Gary

633. How to mount air-wound coil

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-03 00:00:00 UTC
From: wsanders at netcom dot com <exsvg@my-deja.com>
Message-ID: <8jqkaosip1@nnrp1.deja.com>
Source record: 59656

I'm having a lot of fun trying to go bicycle mobile with the RS HTX-10 10m rig. Mounting a whip on the bicycle stinks, and so does mounting the rig on the bike where it doesn't shake to pieces, so I've shifted my strategy to carrying the rig in a backpack and throwing a random wire up in a tree.

So I am building an little 25W antenna coupler and I've wound and tapped my coil, 24 turns of #22 on a 25mm film can, and I doped it with Elmer's Glue (don't use Elmer's to dope your coils :-)) and it's holding together messily but nicely enough ...

How do I mount this thing? It's not quite stiff enough to attach directly to other circuit components - I suppose the best way is to bring the leads through some breadboard, tack the leads down somehow and then mount the breadboard on standoffs.

Another neat way would be to leave the film can on (I don't think I would hurt, at least at sub-kilowatt power levels) and mount the can on some kind of nylon "pole" attached to the enclosure.

If you have a favorite hint maybe you can post it - or if you know of a supplier for clever inexpensive gizmos for mounting airwound coils let us know. TIA.

I am building a project and have run in to a problem that
threatens to eat up all my board space if I don't watch out. My
project needs two clocks, a 16.384 MHZ clock and a 1.024 MHZ one. Is
there anything in the 74HC series that has a port for a crystal plus 4
or more stages of division?

More are fine as long as I can get to the various outputs.

Source record: 59658

If you tried a stiffer wire, just drill sets of holes in a piece of plastic to correspond to the TPI on both sides& wind the coil into it.(just skip the first hole on 1 side & it should go pretty easy.
THen Clear Silicone glue on the ribs.
Maybe even use a piece of angle stockfor the form & screw it down.
Otherwise, Clear Silicone will hold ANYTHING in place.

>That just about covers it.

I was thinking about building one but managed recently to snag an HP 8502A transmission/reflection test set, which is a bridge and attenuator and a DC bias injection path. Indeed, it uses micro-size semi-rigid coax wrapped around a ferrite toroid core for the balun, and a matching (balancing) path is used, IIRC, not only for the balance but for the DC bias injection. By the way, I've recently seen 8502As go on ebay for around $300...which I think is excessive, though I probably have a biased viewpoint about what a reasonable price is.

If there's enough interest, I might be able to assemble a list of references I was putting together when thinking about building one.

To the poster looking for a source of surface mount resistors: try Mouser. DigiKey also has them, but Mouser seems to have better prices. You can go for 0.1% tolerance if you wish.

Cheers,
Tom

In article <20000703164558.17709.00000943@ng-fm1.aol.com>,
The HP 8502A is probably the ne plus ultra of bridges. It was the
last great design in the pre-digital-correction era. Nowadays,
you normally just calibrate out the bridge error with the digital
memory in the network analyzer.

The 8502 is an excellent design to try to copy from and learn to
homebrew a bridge. However, it is an extremely finicky design
in terms of non-obvious details of construction. Your homebrew
bridge is unlikely to equal the performance of the 8502. You
may even end up with some suckout frequencies, so be sure to
check for them.

Having said that, the previous postings (quoted below) are on the
right track. Good luck!

The '4060 cmos (might be available in a 74HC4060) has an oscilator and 14
stages of division. Only outputs of stages 4-14 (except 11) are available.

You might try pop riveting a piano hinge to the box and lid. You may have to find the right size hinge, and maybe use some extra sheet metal between the hinge and the box. Another idea would be to find some flexible plastic stock to replace the hinge and also pop rivet it in place. Maybe teflon of the right thickness would work.

about 23 years ago there were many scrambled over the air pay tv stations. They were filling the void between cable tv and microwave delivered HBO in areas that had neither. Naturally many underground plans were circulated on how to crack the scrambled signals. I built a descrambler for the station running on channel 61 (or was it 69) in the Boston area. They used a very simple circuit to scramble the signal. I used an old tv chasis to build my descrambler on, but a vcr would work as well. They removed the horizontal sync from the signal and put the audio on an SCA subcarrier at 15750 hz (sound familiar?) The horizontal sync was 'synced' to the sca subcarier. My descrambler used an LM1800 sca pll chip to extract the audio and the vco drove cascaded mono-stable multi vibrators (74123) to regenerate the horizontal sync. This was injected into the video signal via at the video amp (after the video detector). The combined video and audio was remodulated back to channel 3 by an external modulator (there is one in the VCR). I don't think there are any of these stations left on the air today, but it was an iterresting project back then.

I thought one of the cable channels did land somewhere below 450MHz in
the right place for ATV. I don't happen to know the specific channel.

I actually use a VCR that doesn't work too well mechanically as a TV
tuner for use with a Commodore monitor instead of a TV set.

The tuners cover a wide spectrum, and might be useful for some sort
of test equipment or wide band receiver.

That sort of thing have been used in many "spectrum analyzers' described
in the hobby magazines over the past fifteen years or so. But I can't
remember if they tune the spectrum without bandswitching, like external
cable converters do, or need to be switched as you move up in the
spectrum.

The front end could be used for a wide-coverage receiver of some kind.
The IF is close enough that you could use it with a narrow deviation
FM filter from an old cell phone.

Or tap the oscillator signal, buffer it, and you'd have a cheap signal
generator.

I imagine most of the tuners have a prescaler connected to the local
oscillator, for use with a synthesizer in the rest of the unit. Sadly,
these will have a large division ratio, which doesn't make it too
useful for narrow band synthesist use.

When I find a VCR in the garbage, I usually strip out the circuit boards,
and take the power transformer. The latter is often quite useful, since
transformers can be costly when bought new. When I get home, I strip
off the useful parts, what I find useful depends on what I need
at the moment and how much effort I feel like putting into the salvaging.
I always keep the tuner modules, though I've yet to put any to use.

At this moment, I'm regretting not taking the time to get the power
transformers out of those two VCR's I saw on Saturday. I was already
loaded down with interesting items I'd found (around here, an awfull
lot of people move on July 1st), including an external cable converter

that has audo and video output, and is probably a neater choice for when you need to tune TV channels than a broken VCR. I'm hoping that CDROM drive I found does in fact work.

Howdy! Got two of my first xtal controlled transmitter projects working. Built one on Saturdy, the other on Sunday after I wanted more power.

Most everything was out of my junkbox, I didn't realize how easy it was to build small tube transmitters! I've been working stations up and down the west coast, and as far east as Utah from Sacramento with the little 6L6 transmitter. I am getting about 4 watts out of it. I wanted something with a little more punch and ended up with about 15 watts out using a 6146B tube with 350 volts on the plate, running about 65 to 75 mA when tuned into a simple dipole. I found the 6146 circuit from the 1969 ARRL handbook. Luckily, I had an OA2 for the screen grid regulator, the purplish glow sure looks cool! I found a neat way to wind coils, and mount them too. I only wound for the 40 metre wavelength, I don't have the acreage for an 80 meter aerial.

Hi Tony..good job..those xmtrs look really decent...in fact, that whole website is cool!

I love to build rigs with tubes too..my present HB rig evolved from a one tube xtal xmtr, using a 6L6 and a two tubr rcvr, using a 12AT7 as a regenerative detector and af amp on a wood breadboard. By and by I experimented and upgraded the circuit over the years..adding an RF amp and another stage of AF to the rcvr, adding a separate xtal osc stage and changing the 6L6 to a 6146to the xmtr ..then adding an AM modulator to the to it..etc etc, then building a wooden box cabinet..experimenting some more..well, to make a long story short, the rig presently contains the following tube linup:

rcvr has
6BZ6 RF amp
6BE6 convertor
6BA6 regenerative I.F. amp
6AV6 detector/AF pre-amp
6BQ5 AF output

xmtr
6AU6 vfo
6GA7 buffer/xtal osc
6146 RF output

modulator
12AX7 speech amp
12BH7 driver/phase inverter
two 6BQ6 in push-pull modulator output

misc tubes
two 0B2 voltage regulators to provide stable DC to the rcvr I.F. and converter stages and the modulator's 6BQ6 screens

all the circuits including power supply (except VFO) are built into a metal cabinet (formerly occupied by a defunct VHF-152A convertor) The VFO I don't use much..I prefer crystals.

This rig runs at 45 watts input on AM and 60 watts input on CW.

one of these fine days I'll get a digital camera and expose this rig on a website :-)

Part of the answer depends upon whether the VCR's are new
enough to have been Cable Ready. Remember, all that junk we hear on 2
meters is Channel E. There are even cable channels blocked out up to
UHF channel 14. I believe that Cable Channel WW actually covers the
432 MHZ band so if your old VCR's are new enough, they might already
be on ATV.

Let's see what else is possible. They are essentially
television sets sans CRT so they have a full video and audio train
built right in them. If you want to mess around with decoding the
digital information in the Vertical Bnanking Enterval or VBE, than
just tune in a channel and connect something to the Video out jack and
you've got TV video.

Don't forget that the sound is available at the audio jacks or
jack. It is deinphasized audio, ready for a highfi system and is as
good as it gets for TV audio reception. You can probably also get
unprocessed audio right from the discriminator if you poke around long
enough.

The RF modulator is a little transmitter with sound carrier
generator so you could call it a test generator.:-)

Have fun.

Ah, those gas discharge regulators. Back in my former life as
an Electronics Technician with the OSU Audio Visual department, I used
to have to go over and work on the equipment for the Foreign Language
Lab. By the time I was here, 1981, that lab had been honing the
linguistic skills of students since 1967. One of the more clever
things it had was a Teacher Call system which, though unused at OSU,
was kind of neat.

The power supply for the lab console and all the student
stations had what appeared to be a tube sticking up out of the chassis
of what, otherwise, was your garden variety solid-state power supply
of the mid to late sixties. This tube was an OB2, I think, which
glowed orrange like a neon lamp.

Each student station had a call button to summon the teacher.

The console cannel had a NE2-style lamp for each position.
The OB2 kept the lamps all running at just below the breakdown voltage
so that when a student hit the button, a little shot of higher voltage
went to that lamp and caused the bulb to fire. The regulated voltage
was sufficient to keep the bulb burning continuously after firing so
it took advantage of the hysteresis which is a natural part of a gas
discharge bulb.

The teacher, after tiring of the lit lamps, could push a reset
which would turn off current to the whole call board for an instant
and extinguish all the lights.

Even though it was not used by the teachers, here, I think the
hardware worked until the late eighties when a diode burned out on the
low-voltage side of the power supply that drove all the audio boards.
That happened to be half of a center-tapped rectifier configuration.
This put a dead short across the power transformer and really stunk up
that end of the building when the transformer finally gave out. The
equipment was 20 years old, by then, and we could only get them a
somewhat replacement transformer. It fit the chassis without too much
drilling and had no high-voltage secondary for the call system, but
they were just grateful to get the audio back on line.

Anyway, the mention of the OA2, reminded me of these old, but
effective latching lamps of the sixties.

>of test equipment or wide band receiver.

Quite true, and you can tap off of the IF which is usually
between 41 and 47 MHZ in a NTSC VCR or TV, but the signal is
often-times, not too pure. If the tuner uses a varactor and there is
a little ripple in the power supply as there often is, then that
ripple serves to modulate all the signals with hum and noise. You
might be able to build an external power supply that is more pure than
the one in the VCR, but some of this ripple may come from the
automatic fine tuning circuit which tries to lock on to the video
carrier.

If the tuner goes all the way up to Channel 82, you will
receive all the 800-MHZ signals that are blocked from many scanners
although, as I said, they may sound pretty bad if you try to connect a
scanner to the IF and receive them that way.

A lot of those varactor tuners have various bands that you
must activate and then provide the tuning voltage to receive every
channel in that band. This means that you could use such a tuner as
the front end for a spectrum analyser or pan adaptor. I think that
there was a project in a "QST" for one of those using a cast-off cable
box.

Just more thoughts.

Neet! I am putting some of my hb projects on my web site.
(www.qsl.net/wa2mze/index2.html)
Currently no transmitter, but you can see my little one tube regen receiver.
The tube lineup on your hb receiver reminds me of thoughts I had many years
ago when I first got my novice license and was thinking of building a
receiver, until an HQ110C became available. I am currently designing another
'retro' project around an old National 'HRO' type vernier dial found at a flea
market. My 'mini' hro will have a regenerative mixer and vfo, if amp, regen
detector, and two stages of audio. Homemade plug in coil forms, and IF cans
from BC-454 receiver. Also have a cw transmitter in mind, 6AG7 vfo/osc mult,
6V6 mult driver, 1625 final.

653. Plans for transmitter Atlas TX110 ???

Newsgroup: rec.radio.amateur.homebrew

Hi guys

I'd like to repair this old Transmitter Atlas TX110.
Has anyone the plans for it ?

best 73's

Still have some good equipment left to dump, before I get into the CB radios and small parts/accessories. Dropped some prices and included shipping on most. Check out the details and photos at www.hightechspecialties.com (I am not a dealer). Please inquire via email: toomuchstuff@pobox.com Thx, Jon

I found that a good coil dope is good ol' "Super Glue" or "Krazy Glue"..it totally welds the turns in place and does not affect the coil's inductance :-)

Yeah I can ping the domain, but can't ftp to the site. The qsl.net server must be down for work. Hope he hasn't gotten hacked! BTW qsl.net is a web host site for amateur radio, ANYONE with a ham ticket can get a free web site just for the asking. I don't know what the disk space limit is, but I havn't reached it yet.

665. 5-watt audio amplifier chip???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-05 00:00:00 UTC
From: Jim Weir <jim@rst-engr.com>
Message-ID: <qof6msgnhi3097btorvsfjuu0tq6sjt195@4ax.com>
Source record: 59595
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc

I'm redesigning an old board to get rid of the TBA-810 that has become obsolete. TBA-810 is a 5-watt automotive radio type chip that is fairly stable and for a communications radio where you aren't asking for 5 watts on a CW basis, it works just fine.

I'm trying my best to find a 5-watt chip like the 386, in that there must be a bazillion of them in use, they are in ready supply, and they are cheap. They aren't the best for distortion, they are sort of cranky as to stability, but they are like the 6V6 or 50C5, they will be around into the NEXT millenium and they are available almost everywhere.

I'm considering the LM383, but given National's move to go away from through-hole packages, it sort of scares me that they won't be around much longer. That and I can't find a second source for them. There are half a dozen proprietary chips around from Motorola, Philips, and so forth, but not one that seems to be an industry standard.

Any suggestions?

Tony,

Neat glowbug transmitters! It sure is fun to build glowbugs
and work the world with them. When (if?) the QSL.NET server
comes back to life, drop by my web site and check out the
pics of some of my glowbugs!

I have a rather large collection of parts that I would like to sell as a lot. Too many items to list here. If you are near my location and serious about homebrew, you should consider a visit.

Located in southwest PA on U.S. route 40 just west of Brownsville. Convenient to I-79, I-70 and I-43.

Message-ID: <rcl6msgc73k3pfdr1n0n4u0f5kj40ilukt@4ax.com>
Source record: 59598

Does anybody have a recommended and reliable source for replacing the NiCads in my HT battery pack with NiMH parts? I'd do it myself, but the pack is pretty well sealed and I don't want to destroy one just to find out the secret of this particular pack. I'm willing to pay for somebody else's training and just send the old pack off for rebuilding..

>
> Harold, N8OCM

If the rf stage is cap coupled to the detector then miller effect is detuning the detector. What happens is that by varying the bias on the rf stage it acts as a varicap diode (no fooling! Reactance modulator). Inducatance coupling will lessen this effect somewhat. This involves adding a primary winding to the detector coil. Use as loose coupling as possible (vary turns, spacing). Old time receivers such as the SW-3 all used tuned rf stages with variable gain so it can be done.

An even better idea, is to use a converter stage instead of an rf stage. Convert your TRF into a superhet. The detector now operates at a fixed frequency. Use a medium freq IF such as 1500khz to keep images somewhat at bay. If you use a separate osc and mix you can make the mixer regenerative to act as a Q multiplier. Still need two plug in coils (ant and osc). Use a standard IF can with a tickler coil added. This can be put in the cathode circuit for electron coupled feedback.

670. Need specs on the old EFJohnson #250-20 Low-Pass filters

My (working) VCR acts as a Very Nice pre-amp ahead of my TV
for over-the-air sigs. Several channels that exhibit considerable
noise without the VCR inline, get cleaned up quite nicely with it.

Hello John,

I have photocopied the Silicon Chip design for the 2KVA invertor but it is 240volt 50Hz output. You will have to modify the secondary of the main transformer to get 120volts. You will have to change the frequency of the crystal to get 60Hz. I suggest you combine the counter and eprom into a single microcontroller but it needs at least 4k of memory for the tables. I am not so ambitious and I only use 1k of memory in a HSC705J1A for my 3 phase invertor. I am posting the photocopies to you today or tomorrow.

regards,

This is a memory stretch so take it as an opinion with a reasonable
chance of being correct. I believe you are talking about the filter
which is cylindrical in shape with SO239s at each end. I also recall
that there was an adjustable cap for the end sections. I believe these
were intended for use only on the HF ham bands so the upper cutoff
frequency was above 10M but below 6M.

679. Parts and QSTs for Sale - 7/4/00 list

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-05 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <20000705061813.06267.00002378@nso-fo.aol.com>
Source record: 59689

I have the following parts for sale. Too much stuff, not enough basement. Shipping (from 19087) is not included. Prices shown are asking prices for single units - let's make a deal! Discounts on quantity purchases. Shipping weights are estimates - you pay only actual shipping charges.

Variable Capacitors

TCS Receiver capacitor/dial assembly - 3 section capacitor with 4" dial and reduction drive (25 turns to cover range). 7" wide, 3-1/2" high, 3-1/2" deep. 1/4" shaft. Ceramic insulation, 2 sections 10-280 pf, 1 section 10-360 pf. Good condition. Price: $6 (4 lbs.)

Power Transformers (all have 117 V 50-60 Hz primary)

UTC S-41 power transformer. Upright, metal cased style with terminal board and solder lugs for connection. Secondaries: 1200 VCT @ 200 mA HV, 5 V @ 3 A rectifier filament, 7.5 V @ 3 A (tapped @ 6.3V) heater #1, 6.3 VCT @ 2A heater #2. Unused, like-new condition, terminals have never even been soldered to. Tested, works. Price $30 (10 lbs.)

Stancor PCR-300 power transformer. Upright, drawn cased style with leads. Secondaries: 550-370-75-0-75-370-550 (multiple taps on the same secondary) @ 300 mA HV, 5 V @ 6 A rectifier filament, 6.3 V @ 5 A heater #1, 6.3 VCT @ 1A heater #2. Used, good condition, leads have been identified and marked. Tested, works. Price $25 (20 lbs.)

UTC R-7 power transformer. Horizontal, "hole in the chassis" style with terminals. Secondaries: 700 VCT @ 100 mA(?) HV (current rating not marked, but at least 90 mA), 5 V @ 3 A rectifier filament, 2.5 V @ 8 A heater #1, 6.3/2.5 VCT @ 2A heater #2 (tapped so both voltages can be used). Used, dusty and a paint is scratched up, fair-to-good condition. Tested, works. Price $5 (5 lbs.)

Filament Transformers (all have 117 V 50-60 Hz primary)

Thordarson 6421 rectifier filament transformer. Antique upright style (from 1930s) with solder lugs for connection. Two independent secondaries: 5 V@ 3 A, 2.5 V @ 10.5 A. Used, tested, works, good condition. Price $3 (4 lbs.)

Isolation/Step Down/Variable Transformers

Stancor P-6383 - Primary is switch-selectable 210/230/250 V, secondary is 115 V. Rated 100 VA. Upright mounting, has built-in switch and 2 prong output socket. Can be reversed for step-up use. Used, tested, works, good condition. Price $4 (6 lbs.)

Superior Electric "Powerstat" variable autotransformer (similar to a Variac). Model 116-U. Input is 115V, output can be connected for 0-115V or 0-135V, continuously variable. Rated 7.5 A output. Open type, panel mounting with 3/8"

shaft, no scale provided. Can be connected for CW or CCW rotation, instructions on terminal board cover. Used, tested, works, good condition. Price $25 (10 lbs.)

Meters

Meter from military I-166 multimeter. Round black bakelite case, white face with scales. 0-100 uA movement. Labeled "calibrated for use in steel panels". Price $5 (1 lb)

Tubes

5687 tubes - These are an industrial dual triode. Have at least two dozen, all test good in Hickock 6000A transconductance tester. Price $1 each, 6 for $5, 15 for $10.

QST

1926 - These are all duplicates from my collection. Old and worn, but good reading. $2 each, or all 5 for $8 (1 lb):

March, 1926 - 96 pages, both covers missing. Some pages stained. Poor-to-fair condition.

April, 1926 - 96 pages, both covers missing. Fair-to-good condition. Better than March issue

October 1926 - 96 pages, both covers present but loose. Good condition. Better than April issue.

November 1926 - 94 pages, front cover missing, rear cover loose. Poor-to fair condition, about equal to March issue.

December 1926 - 112 pages, both covers present, front cover loose. Good condition, almost as good as October issue.

Miscellaneous

Snap Switch - A real antique, surface mount switch meant for house lighting but perfect for antique-style power supply on wooden chassis. Rated 10 A @ 250 V. Round white ceramic base with snap-on brown bakelite cover. Screw terminals inside, wiring is done via holes in the base. 2-1/2" round, DPST with double-break contacts. NOS, excellent condition. Price $2 (1 lb).

Octal Wafer Sockets - Brown phenolic. Have 9 NOS, VGC, 1-5/16 mounting centers, 25 cents each. Also 3 used, GC, 1-1/2" mouning centers, one with pin 6 missing, 10 cents each or free with any order. $2 for all 12. (1 lb.)

Millen HV connectors. These are the classic Millen high voltage connectors. Male (cable) end only! Have one red, one black, used, color is faded but in good condition otherwise. 50 cents each. (1 lb.)

Sonalerts - Model SC 628 Sonalert device by P.R. Mallory. Require 6 to 28 VDC @ 3 to 14 mA. Produce 2500 Hz tone at 68-80 dB SPL. Unused, tested, working, very good condition. Have 3. Price $1 each (1 lb)

Control Box for Alliance Tenna-Rotor. Classic unit from early '50s - sloping front brown bakelite case with meter. Old, beat up, cracked and glued case, some parts missing - a real bottom-of-the-junkbox find. Transformer, meter and switch assembly good. Price 10 cents or free with any order. (2 lbs)

Code Practice Oscillator Module. CPO-4 made by Carl Conover & Co. Mineola, NY. Classic unit from the early '60s - "All American Made!" Consists of a small circuit board with two transistors, one resistor and one capacitor, to be hooked up to a soeaker, key and 1-1/2 volt battery. NOS, still in original plastic bag. Looks like something you'd find at Lafayette Radio in 1962. Price 10 cents or free with any order. (1 lb)

Please feel free to email with any questions, and to make an offer for some or all of this stuff. More to come, too.

7/400

If you need a "true sinewave" you can always take a square wave and use a low pass filter to generate the sine. For high acuracy and stability use a 32,768 kHz crystal (from Jameco - they're cheap) and divide down with a CMOS counter. You can easily find LPF designs in "The OpAmp Cookbook".

You can then use an amplifier to generate the appropriate level of power.

This is the approximate method we used in the Physics Lab I worked in as a youth. (We used an old McIntosh amp!)

You will find the "descrambler" circuits in some of the old issues of Radio and Electronics - you know, the Gernsbach publication - it's changed the name 4 times since I've been reading them. Your public library probably still saves them. From our analog BW TV I know that you can pick up MSNBC (our cable channel 68), Golf Channel, PPV1,2 etc on the low part of the UHF dial. The pay-per-vue come in without having to descramble, just detune!

Whenever I have identified a part like the diodes you describe below, I just plug the identifier into Yahoo, or GOTO and a description usually comes up quickly. To keep the junk box straightened out I place diodes and xstrs on an Avery Label, 1x4 inches, place another label on top and write in the descriptor for the item on the label. When I want a 2n2907 or MPSA56 its right there! Particularly helpful for zeners, schottky rectifiers, MBR's , MUR's etc.

Now if I could just find a way to keep my linear and CMOS IC's that well organized.

683. Regen Receiver Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-05 00:00:00 UTC
From: cheyney.1@osu.edu
Message-ID: <3963205b.471510@nntp.service.ohio-state.edu>
Source record: 59693

Some time ago I built a tube regenerative receiver using a triode Hartley circuit for the detector and 3 stages of audio. I have recently added a tuned RF stage, By rectifying and filtering the output of the first audio stage, before the volume control, and applying this negative voltage as bias to the RF stage I hope to achieve a degree of AGC. The AGC concept seems to be working except that the change in operating conditions at the RF stage detunes the detector and changes the regeneration operating point often driving it into oscillation. I have also tried applying bias manually to the RF stage with the same result. My power supply is choke input and reasonably well regulated so B+ only varies by a volt or two as the RF stage gain cuts back so I don't think voltage variations are to blame. I am using a pentode for the RF amp. The RF stage is link coupled to the detector. Any ideas what I could do to stabilize the detector?

Gday all

Anyone know a circuit to use a stepper motor (eg from floppy drives)
as a rotary encoder?
I am told that if you energize the windings with a small current and
rotate the motor you get a series of pulses. I want to interface these
with a micro for a DDS project. I would be grateful for any info

Richard

>Some time ago I built a tube regenerative receiver using a triode
>Hartley circuit for the detector and 3 stages of audio.

Cool! Tube lineup? Type of interstage coupling, both audio and RF? How do you control regeneration?

As I recall, the Hartley circuit uses a tapped coil, with the cathode of the detector connected to the tap. This has the advantage of simplicity, but the disadvantage of hum possibilities with AC heater supply. Most serious regens (SW-3) used the tickler coild method.

>I have
>recently added a tuned RF stage, By rectifying and filtering the
>output of the first audio stage, before the volume control, and
>applying this negative voltage as bias to the RF stage I hope to
>achieve a degree of AGC. The AGC concept seems to be working except
>that the change in operating conditions at the RF stage detunes the
>detector and changes the regeneration operating point often driving it
>into oscillation.

Which may be why the Ancient Ones didn't do it.

>I have also tried applying bias manually to the RF
>stage with the same result.

Hmmm.

>My power supply is choke input and
>reasonably well regulated so B+ only varies by a volt or two as the RF
>stage gain cuts back so I don't think voltage variations are to blame.

Such a variation can make the difference between oscillation and no oscillation in most regens.

>I am using a pentode for the RF amp.

What tube?

>The RF stage is link coupled to
>the detector. Any ideas what I could do to stabilize the detector?

First off, most of what you are doing (well regulated supply, link coupling, pentode RF) is on the right track.

Second, the effect you are encountering is called "interlocking". In regens with tuned RF stages, it is very difficult to keep the RF stage from getting

into the regeneration business, too. The isolation needed between RF stage and detector stage is far in exces of what a superhet needs, and some things that look "right" simply don't work at all.

Do you have access to QSTs of the '30s? There were a couple of articles on regens with RF stages that are the straight dope on what's what. One was by Ross Hull, and the other by George Grammer, and they describe how to build a really good regen with RF that has no interlocking. Lots of tricks, like not having a common shield between the detector and RF stage.

There was also an series of articles on the development of the SW-3. A LOT went into that thing!

I can look up the dates of those articles if anyone is interested.

686. Military Freqs?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-06 00:00:00 UTC
From: cathexis@erols.com
Message-ID: <3963d210.291771736@news.erols.com>
Source record: 59609

Greetings,

This is not exactly a homebrew question but,....
Does anyone know a good web-based listing of Mil. Freqs?
Though I know I should be working on some project or boning
up on my ARRL Handbook, I've had 6 out 7 nites *and* days
of actual or (ominously) threatening T-storms and I'm dying to
just go out back and "listen to something".

My reciever is a RS DX-392 and will cover 100Khz. to
29,997Khz with SSB, cassette player/rec., including timed rec.
My only antenna is a little RS 23ft. retractable I throw up in a tree.
Still, on a cool, clear nite I do pretty good and feel I got what I
paid for (clearance-priced 84.95US).

Examples of tonite's interest would include the likes of
"Mystic Star" (SSB 6.812MHz.) as used by Air Force One and other
big shots. I should maybe add I live in the Wash. D.C. 'burbs and
so am reasonably close to Andrews, Bolling,etc. A few fighters will
fly over on almost any night. Any ideas if I could listen in on these
birds?? Fast reply appreciated.

TIA,

Andrew (Total Newbie)

Call me when you get a second source in the US for the LM2585 switching regulator too! Digikey has the 383 in stock. If you search on NSM's webpage you can check availability, but Avnet-Marshall (funny, they also own Allied) often has a minimum lot size.

Comet, ceramic type vacuum variable. Removed from functioning equipment, so believed to be in good shape. Unsure of minimum capacitance, but believe it was around 6. Maximum capacitance is 60, rated at 10 KV. Used in RF amplifier operating in the 6 meter range, so would make a good plate cap for a home brew 6 meter amp. Price is $75.00

Since you have 3 stages of audio...why not use output from the last stage to AGC the first audio stage. That's one way that is used to add AGC to a direct conversion receiver. Just a thought. 73

I don't think the 383 is going away anytime soon -- it has been used in
a lot of consumer equipment. As someone else pointed out, Philips
second-sources it as the TDA2002. Replacement parts should be available
on an individual basis from ECG / NTE sources at least until Judgment
Day.

Hello,
I have recently acquired a Motorola VHF mobile rig, that I would
like to convert for two meter use. It is labeled as a "Radius GM300".
Apparently, an external frequency programming method is required. Can
anyone tell me the details of what is required to do this? I assume
that Motorola has no problem with this, given that the radio was already
in the ham surplus market, but I also assume that they would not help
either. Is there a PC based software package available, in the amateur
world, that would serve the purpose here? Any ideas or advice would be
greatly appreciated.

Your are right, Radius GM300 is programed by a computer. You need a hook up cable, not hard to make, and the proper software, hard to get, and if what I have read is true, illegal to have unless licensed from Motorola.

I don't have one, but several hams I know do... they have had no problem getting a local Motorola dealer/repair shop program the radio for them for a small fee. In some cases, the techs will do it for free.

For more info about the radio and how it is programed try http://www.batlabs.com This site is dedicated to Motorola equipment. Also try, http://web.jet.es/colinlowe/motgm300.htm

good luck!

It helps to open the bicycle generator and unground the grounded side.
Then use a doubler, a bridge rectifier, or even a transformer. 10 mph
on my old bike gave about 60 Hz (although we called it cps 'way back then).

From the days that I assembled a single board computer, as I recall,
DOS would send the stepper to Track "0" and then count steps to locate a
specific track. There was no mechanism to count pulses from the stepper, as
that function would be redundant in the operating cycle ie Go to Track "0"
and step to the appropriate track. In contrast the disk itself used the
magnetic information ie. " Format" the drive to read the radial information.
It would seem to me that there are Billions of old 5 1/4 drives using DIP
technology that could be reworked and DOS could be used to locate a
specific sector.

No. Laser diodes used in CD players are designed for CW operation.
They can be successfully be operated with pulse widths of less than 25
nsec but are still limited to peak powers of only a few percent
greater than the CW rating. Laser diodes designed for pulsed
operation are significantly different.

Dear All,
I have an AVO multimeter Electronic CT471A whihc I picked up at a rally. I am looking at servicing it as it is behaving a little oddly on some of the ranges and I can't set some of the zeros.

So:

1) Does anyone have any experience of servicing one of these?.
2) Where can I find a standard weston cell to replace the one in the meter. I think that the one I have is dead. It looks like a fuse and the replacement part is a Doran E 4116, I have no idea where I would source something like this.

Regards

Robin

Not being one to be drawn into a flame war, let's just
call it a night. After sending this post I'm doing a kill-file on this
thread.

Andrew

Greetings all,

I feel I'm ready to start getting more serious about getting
a license. There seem to be a wealth of helpful web-sites out on the
web. I also know that, as of april '00, the catagories were collapsed(?)
to only three (for newbies at least). Could the ng direct me to some of
the web-based tutorials (or books, for that matter) that are the most
helpful and up-to-date considering the recent changes.

In addition, I'd like to ask your opinion about the best way to
go about learning Morse self-study. Some of you have pointed me to
e-bay and I've noticed that code tutors show up there on occasion.
I've also come across the web site "Morse 101" which seemed okay.
Any advice on this and licensing (no code or otherwise) would be
most appreciated.

Please accept my thanks in advance,

Andrew

j-man on January 16, 1999 at 16:36:37:=20

Now here is how you can make Millions of $$$$s or =A3=A3=A3=A3=A3s or =
any currency in the world!!!=20

PRINT THIS PAGE NOW OR YOU WILL BE SORRY!!!!=20

Now you probably have been scanning different news groups to find out =
which one is the best, haven=91t you? I certainly did. But don=91t leave =
just yet. You=91ve probably seen newsgroups which start =90 I was =
looking through a newsgroup, just like you are now=91 =90I was sceptical =
at first=91 and =90I=91ve spent more than that on lottery tickets=91 I =
have seen many of them around. Asking for you to send $6 and you=91ll =
receive $15,000.=20
Well I=91m asking you to send $10 and receive well over $5,000,000 (5 =
million bucks).
I know it sounds crazy but here is what you have to do. Follow the =
instructions CAREFULLY.=20

1) Get 10 $1 bills and wrap them in separate pieces of paper each saying =
" Add me to your mailing list Please." Also your name and address.=20

2) Put these separate pieces of paper and put them into separate =
envelopes, sending each one to the names below. You should now have 10 =
envelopes with each $1 in and with your name inside.=20

3) Now you need to send this message to 200 newsgroups on the Internet. =
What you do is put your cursor at the top and highlight it all and =
select =90copy=91 then open up =90Word=91 or anything to write on and =
select =90paste=91. Now all you need to do is place your name and =
address on the number 10 spot and move everybody up a place, so 10 =
becomes 9, 9 becomes 8 ect, ect, now knock number 1 off the top, so 2 =
becomes 1.=20

4) Here are the names you need to send the money to.=20

1) R L Enterprises, P.O. Box, 808 Festus, MO 63028, USA=20

2) W.C. Daniels, 5910 Transit Rd. Depew, NY 14043, USA=20

3) Chris Adkins, 127 Cupsaw Dr., Ringwood N.J. 07456 USA=20

4)Simon Belgian, 1212 Viola Ave., Glendale CA, 91202 USA=20

5) Creative Consulting, 4302 N. 16th Ave., Phoenix, AZ 85015 USA=20

6) M L Enterprises 27-1300 King St. E. Box 135 Oshwa Ontario, Canada L =
1H-8J4=20

7) S. Soudakov Elmshurst House Bromsgrove School Worcs B61 7Du England=20

8) S. Kerr 21 Serpentine Rd Selly Park Birmingham B29 7HU=20

9) Ewan MacTaggart 10 Cordingley Close Churchdown Gloucester GL3 2EN =
England.=20

10) Pauj Espon Enterprises, 441 Avocet Ave. Davis CA 95616 USA

Now this is how it works.=20
As you post this, to 200 newsgroups and people read and think =90 Ah I =
will join up to this.=91 And let=91s say only 5 people reply (a very low =
number)=20
That is $5. Now those 5 people send out 200 news groups and follow the =
instructions as your name is at number 9. Lets say 5 people answer to =
each 200 news groups, then that=91s another $25. Now if they follow the =
instructions carefully, your name is at number 7 and you get $125. Now =
if those 125 people send out 200 news groups you receive $625. And again =
your name moves up to 6 and you receive $3,125. They now post the news =
groups and your name moves up to 5 and those people reply you get =
$15,625. Now this is where the newsgroups I was speaking about earlier =
finish, that=91s it. $6, 6 places. But now your name is now sent out at =
your name at number 4 and you receive $78,125. Your name has still got 3 =
more places to go yet. So now with your name at no 3 you get a whopping =
$390,625. Once again your name moves to 2 and you are going to receive =
$1,953,125 (1 million nine hundred and fifty thousand, one hundred and =
twenty five dollars!!!!!!) But wait, you=91ve got one more place to move =
up. Number 1. You will receive $9,765,625. Can you grasp how much that =
is Nine Million. Oh no, your name had drooped of the list, oh well just =
start again and get some more MILLIONS rolling in. These numbers have =
only been calculated, if only 5 people respond to each 200 newsgroups, =
just think of how many people are on the net!! It has been estimated =
that 20,000 to 50,000 join the Internet every month!

The reason why you must send off the money in the first place is that =
you create a legal service and this is not fraud. If you did NOT SEND =
THE MONEY then you would be committing FRAUD and can be put away, =
because you are using other people=91s name for your own good.=20

Please play fairly and send the money and you will receive tons, in the =
next few weeks!!=20

Try the following sites, they should help:

http://www.biochem.mcw.edu/Postdocs/Simon/radio/exam.html
http://www.qrz.com/
http://n9avg.org/
http://www.ac6v.com/
http://www.arrl.org
http://members.accessus.net/~dwentz/kb9jja/

The first link is to a very good CW practice and practice written test
site. The others have much general information about ham radio, and
study material. The QRZ.com link has a practice test section that is
quite good. The ARRL link has the complete test question pools, and
other information, including books for test preparation. Best of luck to you.

>
>Now if I could just find a way to keep my linear and CMOS IC's that well
>organized.

I cut pieces of artist's foam (about 1/16" thick) to exactly fit my parts drawer. I can poke the DIP legs into the foam and keep the parts neatly organized. As an added bonus, since most of the foam is living between the DIP's legs, there is essentially no reduction in the capacity of the drawer.

I do a similar thing with LEDs, although here there is a lot of wasted space, and I need to write on the foam since LEDs don't carry markings, and the high-intensity ones are all clear.

I staple diodes to bits of index card. Although diodes are generally marked, I do write the voltage of zeners on the card so I don't have to go looking it up when I need one. This approach has been less than satisfactory, however. I never got the inductor color code down so I treat them the same as diodes.

I put transistors and ferrite toroids in clear envelopes with the type written on a slip of paper. Transistors don't really need it, but the markings on TO92's or SOT23's are small enough that it saves time to have it written down. Powdered iron toroids, of course, don't need help as the sizes are pretty obvious and the mixes are color coded.

For a while I did the label thing, but sometimes the glue sticks to the part, so I've quit that.

I'm looking for a better way to organize caps. Seems like most of the time for any project is spent rummaging through the cap drawer to find the right value.

radioshack.com has their resistor kits on sale. You need 2 kits to cover the range but $16.94 gets you a few of every value and a nice cabinet to keep them in. Also, although it's not apparent online, the quantity discounts that appear in the catalog are automatically calculated. Sometimes the discount can be substantial so if you need a few of something it's worth putting in 10 or 100 and see what price it comes up with. Carbon film resistors, 7 cents in oneseys, are a penny a piece in hundreds, so even if you need 2 dozen of a value, it's better to get 100.

Have you checked out NI1R's page (http://www.fractenna.com/). It takes a little NEC2 work to come up with the design for a particular frequency but it may be what you want.

Let me second that recommendation, that site helped me study for my
license. It's very complete, and the Morse training is excellent.

I would also add one moe site that has practice tests:
http://w5ac.tamu.edu/ham-exam-v2/ham-exam.html

Good luck!

Has anyone tried the Phase tuning circuit described
in the Don Johnson book 40 + 5 Years of Mobile ??

This circuit determines if the antenna is inductive or
capacitive and and makes the motor turn in the direction to compensate.

Hugh;

You are looking for about 17 dB of gain. You will not find that in a single stage amplifier.

For discrete devices, going from 1 to 10 watts works, and from 10 to 50 or so is acheivable. Take a look at rfparts.com to find what is still available. What has worked for me is using 450 MHz parts "derated" to 220. I would not use 175 MHz parts "pushed" to 220. You will be disappointed.

Yes, Motorola has given up the market for VHF/UHF power parts, but some are still available for single application needs.

I have just finished the design for a 220 MHz, single channel, crystal controlled, FM transceiver project for our club. It was difficult to find an economical PA device to put out 2 watts, but we did find it.

73

You need more than just a "Hook up cable". You need a "Radio Interface Box". These things are a bit pricey and hard to come by for the real Motorola box. I use one made by Polaris that cost about $100 sometime ago. Your best bet is to go to a service shop/two-way dealer. Most are very accomodating to Hams, and sometimes you can have a Tech do it for you on his "Lunch Hour" for less than going through the front counter.
73, Jim

Source record: 59501

I have been looking at circuit simulation software that runs on Windows 98. Searches on the WEB have found several products. Circuit Maker 2000 and the ARRL Radio Designer, etc.. But there must be a few folks out there that have experience with these packages and I am interested in your comments/recommendations.
I am looking for software that will accept standard SPICE models. PCB layout capability is optional for me.This is for hobby/home use.

729. Serious warning - why?

Source record: 59502

Hi!

Today I bought a 829B tube (JAN-CRC-829B CV2666) for my collection/tube
museum, and a big warning on the box says:

NOTICE--IMPORTANT

This electron tube must remain WITHIN THIS CARTON AND WRAPPING. IF SHIPPED,
this unit must be protected by being surrounded by not less than 2 INCHES of
excelsior cushioning or its equivalent and packed in another container.
FAILURE TO OBSERVE THESE INSTRUCTIONS WILL RESULT IN DAMAGE TO THE TUBE.

Why is this so? Why did they mark the carton in this way? What damage do
they speak about?
The tube is mfd. by Radio Corp. of America - date pkd. 11/56.

Just wondering....

730. Warning! -- SONY SUBSTANDARD SERVICE

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-08 00:00:00 UTC
From: An_American_Consumer@huwqsounq.edu
Message-ID: <7EE581852A6E6.hybwbeecabe@jtoxxkirv.edu>
Source record: 59503

Anyone considering the purchase of a Sony peripheral for their computer might want to give it some further thought. There clearly is not a reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad (won't read). When I called Sony service, I was told that I could not get a replacement and that I had to ship it across the country to be "repaired" (and we all know what that means...) - with a three (3) week turnaround. Assuming that they keep their 3-week commitment, with shipping both ways, I'd be without the use of the unit for at least five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an obligation to scale their service facilities to meet demand. To not do so is an indication of their lack of commitment to customer satisfaction and an unwillingness to stand behind their products.
-
Buyer be ware!

Bill

There seem to be 2 main choices; WinSpice is free, or go out and purchase MicroSim or some similar package costing perhaps thousands of dollars. If you're interested in the big bucks approach, send a note to Jim Kortge, K8IQY. He has, uses, and loves one of these expensive outfits.

WinSpice is kind of lame in circuit entry, but it does a good job of modeling, and there are models of most of the parts you are likely to run into available. Chuck Adams, K7QO, did a tutorial on QRP-L a while back. A summary of that tutorial is available on his website http://www.qsl.net/k7qo.

WinSpice, the models, and the entire tutorial thread are available on the QRP-L CD. Take a peek in the QRP-L archives (http://www.qrparci.org/qrplacc.htm). Here you will find the tutorial, although in the online archive it can be tough to follow (I think it was around the fall of 97). It's a little easier to find on the CD which allows you to search across years. Once a month Jim Larsen, AL7FS, posts a note containing a list of the volunteer distributors of the QRP-L CD. You can find this in the archive also (ftp://ftp.lehigh.edu/pub/listserv/qrp-l//archives/2000/000702). The CD is $10 or send the distributor a blank CD-R and prepaid mailer - Jim has all the details in his posting.

There are a number of sites where you can download WinSpice, and other sites where you can find models.

Hi gang,

We are probably all familiar with the solder type protoboards that Radio Shack sells for leaded ICs with pins on .1" centers. Does anyone make something like this for surface mount chips? I'm thinking of something that would allow you to drop a standard sized chip carrier onto the board, solder it in place, and have each lead fanned out to a small, but accessible solder pad to connect other non surface mount type components. Kind of an 'expansion' board if you will.

This would facilitate using these tiny devices in dead bug construction. Thanks for any input.

Hello--

The main concern is shock and vibration damage-- anything from outright
breakage of the glass envelope or damage to the pins' glass-to-metal
seals, to displacement of electrodes within the tube. If the grid-to-cathode
or grid-to-plate spacing shifts, the tube's properties are altered.

If you're not subjecting the tube to handling, you can safely put it on the
shelf
sans box. You might consider making a wooden block base with holes drilled
to receibve the tube's pins, and secure the tube to the base with a dab of
silicone sealant beneath the base.

73,
Brad AA1IP

Hello--

IIRC, there are universal boards available, but they're expensive and not commonly found in surplus at present.

If you need something more permanent than a Protoboard and want to stay in a DIP format, I have a batch of Global Specialties Experimentor (tm) PC board EXP-300PC boards FS.

These phenolic printed-circuit boards feature patterns of holes and traces that match GS' popular solderless breadboard. Rough out your circuit on the breadboard, and then build a final copy on one of these PC boards. (You can use one of these over a copperclad-board ground plane for better HF performance, or add strips of adhesive-backed conductive copper tape as buses.)

These are NOS (new old stock) boards in carded, shrinkwrapped package, and a sample presented no solderability problems (the traces are tinned).

Price: $1.50 each (or 4 pieces for $5.00), plus postage.

740. Want to build a signal generator

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-08 00:00:00 UTC
From: "Matthew D. Strandberg" <kj7dx@dakotacom.net>
Message-ID: <3967d06c_2@corp.newsfeeds.com>
Source record: 59513

Hi. I'd like to know if anyone out there has built an RF Signal Generator that would work in the 420-450 MHz range. They're pretty expensive to buy, so I was wondering if anyone has built one and how big of a project it would be. If you have any schematics or info for building one, or have built one yourself, I'd love to see what information you have and what you've done as far as completing such a project.

Thanks,

Matt

The main thing is how stable, well shielded, and how accurate must the
frequency be ?

You can find some of the older test sets for under $ 50 at the hamfests,
baybe on e-bay. There is the HP-608 that may cover that range. they
make several modles.
I found an old Singer test set for about $ 150 at a hamfest that would
go from almost audio to 500 mhz that will gemerate and receive. Unless
you are very capable it is doubtful that you could even come close to
the shielding, accuracey and stability if you built one.

You may be able to find some older 2 meter rigs (especially if the final
stage has gone bad) that tune 140 to 150 and either the harmonics can be
used or a trippler stage can be built.

Hi! my name is Eris,I am selling this inventory of vacuum tubes
for an older lady wcich her husband passed away,there are
between 3000 to 4000 tubes which 75% of them are NIB or NOS
they are mostly receiving,audio and some transmitting tubes.It would
be too long to make a list.This fellow had is own business in
electronic
and was specializing in tubes equipment.
Asking $700.00 US firm
plus shipping.
If interested feel free to email
me...Thanks....73

>
> Just wondering....
>
> -Willy

Hi Willy,
Never drop the tube, allow anything to drop on to the tube,
otherwise your life is in real danger.
These tubes have the special warning printed on the carton because of
their unique construction.
Only ever handle the tube with tongs, whilst wearing a lead apron, helmet and
gloves.
The tube envelope is a radiation proof lead-glass.
The cathode is coated with 100 Mcu of highly radioactive Stronto-thorium 295.
The glass envelope is filled with Radon gas to a pressure of 10lbs per square
inch.
And lastly, don't be afraid, I am only joking!
All the best,
Duncan G4DFV

749. FS: Box of 17 ARC-5 Variable Capacitors

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-09 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <20000709063856.02660.00001177@nso-fj.aol.com>
Source record: 59522

Hello Folks,

A few months back, I offered some variable capacitors for sale, and made a deal with someone for 17 of them. Unfortunately, through no fault of his own, he was unable to complete the deal. However, I packed them up for shipping while waiting, and they've been sitting in the box ready to ship for almost four months now.

So here's the deal: I'm offering the entire lot of 17 capacitors for $30 plus shipping from 19087 - that's an average price of less than $2 each. Of course some are more valuable than others, and condition varies from excellent to poor. (I just don't want to have to unpack and repack them all over again).

Here's a detailed list:

Oscillator tuning capacitor #5032 (from ARC-5 transmitter) - Single section variable, 30-150 pF. 16 rotor and 16 stator plates, .0625" spacing. Has beautiful 100:1 reduction gearing with antibacklash gears, but no dial. 2-5/8" high, 4" wide, 2-3/4" deep, with 3/16" shaft. Used, good to very good condition. Total of 5 of these, 3 with the flexible coupling shaft, 2 without.

Oscillator padding capacitor #4990 (from BC-459 transmitter) - Single section variable, as used in Command set transmitters. Has rotor lock and temperature compensator. Very good condition. Have 4 of these, all from BC-459s.

Oscillator padding capacitor #4990 (from ARC-5 transmitters) - Single section variable, as used in various Command set transmitters. No rotor lock. Fair to poor condition, need cleaning. Have 2 of these.

Amplifier padding capacitor (from ARC-5 transmitters) - Single section variable, as used in various Command set transmitters. With rotor lock. Very good condition. Have 1 of these.

Amplifier padding capacitor (from ARC-5 transmitters) - Single section variable, as used in various Command set transmitters. No rotor lock. Good condition. Have 1 of these.

Amplifier padding capacitor (from ARC-5 transmitters) - Single section variable, as used in various Command set transmitters. No rotor lock. Fair to poor condition. Have 3 of these.

3-gang main tuning capacitor from BC-453 receiver. Has padders and trimmers, no dial. Good condition. Have 1 of these.

Total weight of package 22 pounds. 17 capacitors in all. All packed up and ready to go - but you gotta take the whole pile!.

Have an old KW rig that is in desperate need of repairs. I have manual; but can't seem to find anyone around that will work on it.

Got some cheap coax and wired up an antenna and ended up loading into an open (coax didn't take the solder). As well, the VFO knob needs to be refitted with the string to tune.

The rig was my first rig purchased by my parents for me back some time ago.

Dear All,
I am looking to either obtain a voltage reference (Weston Cell) for an AVO meter that I have or come up with a substitute form of voltage reference.

So, does anyone know of a source for Weston Cell type voltage references or does anyone know of any suitable substitute forms of references?.

The part I am trying to replace or substitute was made by a company called Doran, who I have never heard of, does this ring a bell with anyone?.

Cheers

Robin

I would recommend modifying the rig to use 6146B's There was an article in QST awhile ago on doing this for a similar radio. The sweep tubes are becoming impossible to find, and VERY expensive. 6146's while not cheap, are available and the price seems to be stable. You can still get a pair for $20-35.

I have a few 12BY7's I don't need. You can have them for $3 each plus postage.

This is not a good idea for CMOS or FETS. Use the black conductive foam
to prevent ESD damage. It isn't recommended for bipolar components, but
they aren't quite as susceptible to static damage as feild effect parts.

770. Homebrew Amplifer for matching tansciever

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-09 00:00:00 UTC
From: gbowne <gbowne@email.msn.com>
Message-ID: <#4ytdAj6$GA.280@cpmsnbbsa09>
Source record: 59543

I am looking to build an Amplifier for use with my homebrew transciver project.

It should be upgradeable internally so that later it would be an amp with up to 1.5Kw to 2Kw, but no less than 200W PEP..

I am designing this ampilifier similar to those found in the 1981 through 1993 ARRL Handbooks, but maybe even better. I have all of these handbooks for reference materials.

I am contimplating using either tubes like any of the 3CX or 4CX series or similar tubes, but would even concider the low output tubes. The other way I would go is like the little brick amps made for the 144/220/440MHz rigs.

Could anyone suggest a tube?

I especially want to work 7.100-7.150MHz and 3.675-3.725MHz.

Thanks,
Gregory Bowne

If you have any local printed circuit board houses in your area, they might be worth a try. They might have some large scrap pieces that they will sell. As an example, an 18 by 24 inch sheet of FR4, 62 mils runs about 8 dollars, in bulk form.

If you go to Orcad's website, you can order the evaluation version of
Pspice, on a CD Rom, free of charge. This version has all of the features
of the full blown version, limited only in the size of the circuit that you
can simulate. This package includes schematic capture, simulation, and pc
board layout capability.

If you simply want a 1.2V precision voltage source, look up "Voltage
Reference" diodes in any semiconductor catalogue -- RS, Farnell, Maplin
etc. (my out-of-date Maplin cat helpfully omits the section from the
index, but it _is_ there).

If you want to the real thing, your best bet is to ask a school physics
teacher. I expect these are still taught!

Hello Everyone:

I had 2 pieces of Ham radio software that was deleted from my HD. One was called pifilter.exe and the other was toroid.

Pifilter.exe allowed one to generate a pi filter comnfiguration for low pass and high pass filters.

Toroid allowed one to generate a configuration for a particular value. It gave the number of windings.

Anyone know where I can find these now?

SOme years back, there was an article in Radio Electronics (or maybe it had morphed into Electronics Now by the time of the article) about doing this. It's the only article I've seen on the topic, though I must assume others have tried it. I don't have the article handy, but basically, you fed the wires from the stepper motor into a pair of comparators to get a digital signal. I sure don't remember anything about needing to energize the windings.

The idea has come up in the newsgroups, maybe even here, and I do recall someone mentioning something about how it didn't work so well for a dial because there weren't enough steps, or something.

Of course, you don't have absolute information from this, just pulses at the rate you are turning the stepper, and since the windings are 90 degrees apart, information about the direction.

You'd have to feed the comparators into an up/down counting chain, in the same way you'd need such a chain if you had an optical encoder.

Or, since you have a microprocessor in the circuit, you'd need to use it to convert the raw information into the needed information.

If you can settle for a single frequency, or at least a handful of frequencies,
it would obviously be a lot easier than if you need full coverage.

Years ago, like with a lot of things, you'd often see self-contained
crystal controlled signal generators for the VHF/UHF bands described
in the ham magazines. They weren't much more than a low power transmitter,
with some sort of weak modulation. By making them crystal controlled,
you didn't have to worry about frequency calibration, or drift. And since
the circuitry was simpler, you could put it into a well shielded box
with no external connections except the output. This keeps down
spurious radiation, which you want to keep to a minimum in a signal
generator.

Often, these generators would start with a 48MHz crystal, since multiplied
by three you'd get 144MHz, and by three again would give you 432MHz. Starting
with such a high frequency, at least compared to the then-common use
of 6 or 8Mhz crystals in such transmitters, mean that you wouldn't
be likely to pick off the wrong harmonic, and you didn't need the
circuitry to get up to 48MHz.

Nowadays, I might suggest starting with one of those TTL oscillator modules
that run off 5volts, especially since 48MHz seems to be commonly available.

Of course, this won't work so well if you need a different frequency,
and if you are dealing with channelized frequencies, like for FM operation,
you'll need a frequency that will land on such a channel.

One you've got the weak signal, you'll need to have some sort of attenuator.
I don't think slide switches and resistors will make it at that frequency.
Maybe you could dig up some sort of surplus attenuator rated at the frequency

range.

Or one common scheme was called an "infinite attenuator" where you'd have two tubes, one that slid inside the other (and I'm forgetting some details), and the more the outer tube was extended, the more the attenuation. It's not something you can set to an exact level, but it's a cheap way of getting a weaker and weaker signal, as needed when tuning something up.

One such generator I recall, just basically built the crystal controlled generator into the "inner tube" (I think he actually used something that was square").

If you start running such a generator off AC power, or even an external DC supply, you have to start dealing with keeping the RF inside the box.

The stepper motors I have here seem to have a permanent magnet rotor. So just turning the shaft gives pulses out.

One possible approach would be to use a cheep radio scanner that covers the range. These often put out a signal plus or minus the IF of the 'dial frequency' that's X dB or so down. If that output level is satisfactory for your needs, you are in business.

I've mused that one could with very little effort come up with an inexpensive service monitor capable of receiving and transmitting. For years, have used a scope hooked directly to the scanner detector output for measuring FM deviation and frequency. For a signal generator one should be able to tap into the scanner at an appropriate spot and switch in a wideband amp stage or two, along with an attenuator for higher level calibrated output. With a little mental gymnastics, one would have a fairly precision RF source.

788. Re: How to mount air-wound coil

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-10 00:00:00 UTC
From: wsanders at netcom dot com <exsvg@my-deja.com>
Message-ID: <8kdknv$eb5$1@nnrp1.deja.com>
Source record: 59463

Thanks to all who responded - I ended up gluing the coil down to a piece of cardboard and mounting the cardboard on standoffs. This is a junk box tuner - I happened to have two air caps (210 and 365 pf) lying around and needed to put them to use. I made a Pi-network with the caps on the legs of the Pi and the L on top.

Unfortunately the haphazard wiring layout I used induces enough stray inductance that even with all the turns shorted out the lowest SWR I can tune it to is 2:1 into a dummy load (the SWR is even higher with more turns). I need to sit down and pencil push and figure out what inductances and capacitances I need to really make it work.

Never even thought about using a bicycle generator. I have a motorcycle battery that I carry in a saddlebag.

I did get out and operate - I took the base-loaded mag-mount cut-down CB antenna and made a crude ground plane out of a large, rolled-out tin can. I attached this contraption to the rear rack and carried the 10 meter rig in the front bag. I was able to raise no one - the antenna is just too crummy. It doesn't work worth warm spit even installed on top of a car. I think a long wire dragged behind the bike on the ground would even work better.

I was however able to do a good RFI survey of the neighborhood - good grief what do people have in their houses these days - some houses pegged the S meter for a 200-foot radius!

789. Help with locating information (and advice) for building a remote

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-10 00:00:00 UTC
From: ghopper@eskimo.com
Message-ID: <ghopper-1007001558270001@07-138.009.popsite.net>
Source record: 59464
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I am starting to look for projects for the winter months so I can get my parts orders together. One of the things I am interested in putting together is a multi output remote controlled switch. The most common design I recall seeing is via DTMF control. A company down in oregon sells an 8 or 16 output switch that uses a 4 digit DTMF security code and a 4 digit code to turn on and off the outputs (or in some cases, just cycle the output like a momentary switch). I don't remember their name off the top of my head, but the point is that I would like to design and build something rather than just buying it.

I recall an older QST article on the subject, and I believe that radio electronics had an article too. I haven't located either yet, but I'm looking for pointers to ANY information on designs (or just ideas) for design of something like this.

Any help is appreciated!

Might one of you kind souls have a pinout for the accessory socket on the back of the IC-271A/471A rigs? I think this was the same for the 251's as well but need it for a IC-471A.

One of the concerns is that not all stepper motors are permanent magnet
motors. I seem to recall that it is possible to build a variable reluctance

stepper motor, although I don't know how common they are.

In any case, even with a permanent magnet stepper motor, if the shaft is turned slow enough, the pulse may not have enough amplitude to detect.

One answer might be to excite the windings with a low amplitude AC, and measure the current flowing. Due to the difference in inductance with respect to the rotor position, it may be possible to detect which way the rotor is being turned and what the position is.

Of course, the exact implementation is left as an exercise for the engineer.

Dave

DigiKey has these little programmable Epson oscillators for any frequency you want up to 100MHz or so. For three bux add +5 volts and you have RF. Add a little multiplier circuit and you should easily get in your neighborhood. I expect the output is pretty square (tho I admit I haven't looked) so you may very well get away with an 88MHz oscillator and a little bandpass filter. Put the thing in a socket and you can get a few frequencies for $3.30 each. It's a lot simpler than trying to build a VFO that would be stable after you multiplied it up there.

Alternatively, you could build a VFO at some lower frequency and mix it up there. If you really need complete 420-450 coverage, tho, it will be tough even to come up with a stable VFO that can cover a 30 MHz range. But the alternative is synthesis which can get complicated (=expensive).

: applying this negative voltage as bias to the RF stage I hope to
: achieve a degree of AGC. The AGC concept seems to be working except
: that the change in operating conditions at the RF stage detunes the
: detector and changes the regeneration operating point often driving it
: into oscillation. I have also tried applying bias manually to the RF
: stage with the same result. My power supply is choke input and
: reasonably well regulated so B+ only varies by a volt or two as the RF
: stage gain cuts back so I don't think voltage variations are to blame.
: I am using a pentode for the RF amp. The RF stage is link coupled to
: the detector. Any ideas what I could do to stabilize the detector?
:
: Harold, N8OCM

--

If you are using a super regnerative circuit, then you might not need
an RF amp or AGC. The main advantage of an RF amp is isolation.
A super regen can radiate and a carefully-designed amp can reduce
this radiation. You can add an AVC after the detector.

Take your stepper motor. If it is from a floppy drive, you will find either 5 or 6 leads from it. These will be the connections of 4 windings with a common centre tap or 2 sets of centre tapped windings. You can check them out with an ohm-meter.

Connect your voltmeter set to a low range AC scale to the leads for one of the windings and twirl the rotor. You will find that a speed related voltage is generated.

Use your oscilloscope to view the waveform. You will find a sinewave of aamplitude and frequency related to the speed of rotation is generated. With a twin beam oscilloscope, you can establish that the 4 windings will give you a set of sinewaves in quadrature.

If you have one of the old full height 5 1/4 inch floppy drives, you will find that the motor which spins the disk has a tachometer output. The motor control printed circuit board contains a speed regulation circuit using a frequency to voltage converter IC. This board is small and easily reverse-engineered if you want to adapt it for other purposes.

There is a good article "Stepper Motors as Shaft Encoders" in the February 1994 issue of Electronics Now.

Well, we do build such things here, actually covering a bit wider range
than that. I've thought in the past about building something fairly
simple for home use, but have managed to snag things at auctions that
will do the job. But here are some comments:

If you don't need much freq stability, you can make a VFO, mechanically
or electrically (varactor) tuned to cover nominally that range. Since
it's a pretty narrow range, you should be able to tolerate what
variation in amplitude you get. Build it REALLY well shielded...it
doesn't take a very thick copper layer to do a good shield at
400MHz (but don't leave any holes; keep it low power and solder it
completely shut--beware shafts of mechanical controls acting like
antennas to feed sigs through the shield.)...and pass all control and
power leads through good feedthrough filters. Get the signal out
through a good coaxial connector, or through some small semi-rigid coax
soldered directly into the shield box. Put that into a switchable
attenuator, also well shielded. You might consider a level meter
between the osc and atten, and possibly a variable control (only needs
to have a few dB range; let the switched atten do most of the work).
You might consider a (very well shielded) freq counter fed from the osc,
too.

You can get to much better freq stability by using a PLL chip, but you may then be limited to, say, 5kHz steps. You could also use a DDS chip (see Analog Devices, for example) and multiply it up. One way to multiply it up is using a PLL. For example, you might be able to get a Motorola MC13175/6 which will do a fixed *8/*32 PLL multiplication up into that sort of freq range. You can also do a "frequency locked loop," but given that a PLL is about the same difficulty as a FLL, I'd personally suggest the PLL or DDS approach. Our patent on "fractional N PLLs" has expired and there are some ICs that implement that, too, though beware that some are not very wonderful at keeping spurious responses really low.

So...you can keep it simple for limited performance, or enhance it for better performance. -- Also, check for old QST and Radio-Electronics and Electronics World + Wireless World articles...I'll bet you'll find something you can use there, either directly or with a bit of modification. But also, don't expect to get to really low spurious emissions with any simple homebrew approaches.

If you want the esthetics of a standard cell, I suppose there's pretty
much no substitute, but there are some very good voltage reference ICs
from Analog Devices, Maxim and Linear Technology, for example. Even if
the initial voltage is not what you need, you should be able to scale
and buffer it adequately. You can get precision resistors with very
good temperature tracking, so they maintain a very nearly constant
ratio, and inexpensive chopper-stabilized op amps with microvolt-level
offsets to buffer the result. I'd expect with some care you could get
to around 10ppm/degree C without having to go too far off the deep end,
though it will likely cost you quite a few pounds if you go for really
good resistors for a divider (unless you get lucky and find them
surplus).

Take a peek at http://rocky.digikey.com/USCatalog/V3/267.PDF - the top half of the page. You order these rascals by frequency. The 5 volt parts go from 1-125 MHz, the 3 volt only to 106 MHz, unless you need the wider temperature specs.

You order these parts for the specific frequency, and DigiKey has to program them. As a result, if you order them late in the day your order may be delayed a day. This gets the telephone order takers all upset so you need to assure them it's alright. As best I can tell, you can't order these things over the web since you can't supply the frequency, but the phone works just fine.

I haven't seen any threads on this so I figured it'd be interesting to start one...

In the early days of computer controlled devices, if we wanted to make the thing do various things that were never intended by the manufacturer,
we'd get into the thing, dump the ROM, disassemble it and figure out how the thing was programmed. Then, figure out how to reprogram it so it would do all sorts of whizzy things we wanted.

Now, it seems to me that doing this with these fancy new computer controlled marvels would be a great endeavour, but I've never heard of anyone doing this. Why? Are these things just too complex? Are the CPUs too proprietary so you can't get any info on the instruction set? Are people just not into "hacking" any more? Have HAMs just gotten to the point where the only mods they feel like doing consist of cutting a wire or removing a resistor?

I don't know. In my own case it's mainly the fact that I hardly have time any more to talk on the radio, let alone figure out mods and hack code. But, it's sure be fun to really get into the guts of these things and really figure out how they work.

Has anyone ever heard of anyone doing this? Does anyone have any inside contacts at Kenwood, Icom, etc. who might know about the design and programming (doubtful since these NG's seem to be mainly North America and Europe based, but there could be someone out there)...

An old hacker gettin' the bug again...

Many uP mounted ROM arrays (eg. some in the MicroChip PIC series)
are un-dump-able now-a-days.

Another option is intercepting the control strings as they go by, and use another PIC to change the values 'on the fly'. This is how I use my /\/\ mtx-900 on 900 megs...

You'd probably have to do it this way as many of the EPROMS have a fuseable link and burning the link to prevent reading the code is quite popular. That only leaves recording the control strings as they go by.

Or...reverse engineering the thing, treating it as a black box, figure out what kind of outputs it has to have to do something with what kind of inputs, draw the logic diagrams for each and then using Boolean algebra, simplify the equations to get the final configuration.

Neither are easy for any one who has not done them several times at least. You also need the background to be able to interpet the information. It's definatley not intro to comuters 101<G>

I had one class that ran two hours twice a week for one whole term and that was pretty much all we did. Boy, what an exciting way to spend four hours in class and about eight studying per week

I had one class where all of the programming was done in machine code (not assembly, but pure Hex) and some of the programs ran several K. They were keyed in from a numeric key pad and we had to be able to run them, exit gracefully and then rerun them (we had volatile storrage). If it didn't exit gracefully you had to key the entire thing back in.

818. Power supply for voltage controlled oscillator

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-12 00:00:00 UTC
From: kent_i@fnmail.COM
Message-ID: <3.0.6.32.20000712193852.00796100@mail.fnmail.com>
Source record: 59347

I am going to try constructing a VCO for the MW band (530-1650 kHz) and I am in need of a very clean power supply circuit eg. one with very little noise on it, because I'd like to make this VCO very stable. The supply will be for 12VDC and I won't be needing much current so it doesn't need to be too heavy duty. I was wondering, would a car battery provide an excellent source of clean DC or would it be better to try and build a very well regulated P/S from the 240V mains (I'm in Australia). Can anybody help me with ideas on how I should go about building a very clean P/S?

Cheers, Kent

>and buffer it adequately.

There were details of the Maxim MAX6190 1.25V reference in the June 'In Practice' column. Performance is excellent, probably better than any Weston cell outside of a lab environment. See my web site for links to the data sheet.

Maxim are happy to provide free samples to individual constructors.

Hello--
You *might* be able to use a UHF tuner mechanism salvaged from an
older (preferably solid-state) TV receiver by padding the tuner's LO
downward and adding a coupling-loop probe into the oscillator compartment.
You couls also remove capacitor plates to get more bandspread, but
uou'll need to analyze the circuit for best results.

You could also add a MMIC buffer amplifier to get more output. You'll need
to create a well-regulated power supply, too.

Advantages: cheap, mechanical vernier drive usually included, moderately
well shielded, available at any yard sale<g>.
Disadvantages: stability may not be adequate for your needs.

Just how clean do you need to be?

Modern off the shelf voltage regulators have excellent ripple
rejection - my bench supply, for example, consists of a surplus
transformer, a bridge rectifier, a couple of big electrolytics,
and a 5 amp low-dropout regulator (LT1084) bolted to a big heat-
sink. I can just barely detect the output ripple: it's far
enough down that I'm not confident I can meaningfully measure
it. This supply runs various direct-conversion receivers (among
other things) without any fuss. How much better does it need
to be? Even "battery pure" DC is limited by noise pickup on the
wires...

Car batteries are messy. Use a gel cell, or use some dry cells
or something similar. Depends on just how much power you need.

Subject: ** FLEA at MIT ** Sunday July 16th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming SUNDAY !!

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 16th 2000
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23-W1BOS/R and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

That's interesting. The stability specs (50 or 100 ppm) suggest they
aren't temperature-compensated, and they don't offer any other specs
like phase noise. Wonder how the programming process works -- some sort
of while-you-wait laser trimming? Have to poke around on the Epson
site, I guess.

How precisely can the frequency be specified? Down to the tens of
kilohertz? (The charts show two significant digits to the right of the
MHz decimal point, so that looks likely).

You can't get much more AC free than a battery. Although in reality modern day power supply design is very quiet if designed, built and operated within design parameters. Either way should fit your bill. Be aware that many of today's well regulated switching type power supplies have 20 kHz fundamentals with harmonics and broad band noise radiating well into the VLF/LF range.

>site, I guess.

I don't know, other than it's apparently a pretty quick business. Once I ordered a couple by phone around 7PM. The girl who took my order was very apologetic that the order couldn't be shipped that day because the girl who did the programming had gone home. About 15 minutes after she arrived at work the following morning, the order taker called me to let me know my parts had been programmed and would be on their wat that day.

And I really don't have a way to measure the phase noise. It *DOES* make a nice clean note in my Fireball 40 tho, but it has a low pass filter after the oscillator to clean it up, and at the FB40's power level, any noise would be hard to discern.

>How precisely can the frequency be specified? Down to the tens of

I get the impression you can specify the frequency at least to the kHz, but I have to admit that all I've ordered have been round at the tens of kilohertz place. But one I have is marked 6.800

Chipmunk BASIC used to come with several ham-related samples, but I've noticed that newer versions have omitted most of these (still includes one or two). You might be able to find an older version somewhere on the internet that still has them.

There once was an excellent site like this in Germany. It had about three dozen ham-related programs, nearly all written in Chipmunk BASIC (complete with the text for you to modify). Sadly, the web site designer announced one day that the site was moving, with a notice that the new address would be announced soon. The new address was never announced, and eventually the site disappeared completely.

I wish I could offer you more, but I'm not aware of any site available today that has what you're looking for.

Source record: 59493

>> Also watch out for CRTs. Their large second anodes can store enough of
>> a static charge to make you jump and drop the tube when you're removing
>> it.

I'll expand a bit on this item..the CRT (cathode ray tube or picture tube). The second anode is the connection under the suction cup on the wall of the picture tube. When a set is operating that connection can carry between 25 and 30 thousand volts! When the set is off the tube can act like a capacitor and hold that charge. Therefore it is very important to discharge that connection when servicing the tube. Connect a cliplead..one clip to the ground strap wraps along the back of the tube and the other clip to a metal slot screwdriver (with a big plastic handle!) ..slip the tip of the screwdriver under the suction cup until it contacts the connection under there. Usually you'll hear a SNAP as the stored charge discharges into the screwdriver tip. Do this a few times, as the tube can re-accumulate a charge..I like to connect a clip lead between the anode connection and the ground strap after the initial discharge to prevent the tube from re-accumulating a charge while I work on the chassis, or if I need to remove the tube from the set... I tape a bit of wire or ground strap to the conductive coating on the back of the tube and connect a cliplead between the strap and the anode. That way I am assured that when I pick up the tube I won't get zapped by any residual charges in the tube and drop it. Dropping a CRT can be like setting off a glass shrapnel bomb. The tubes contain a high vacuum..if dropped the glass can shatter, the air rushes in with trememdous force and can blow the broken glass out in all directions..extremely dangerous because the broken bits of glass can travel at high velocity and strike and severely injure or even kill a person if the glass hits a spot on their body such as in the neck, cutting into the jugular vein, etc. Tubes made nowadays have SOME degree of protection against the tube becoming completely shattered, such as the metal band around the screen area which can help prevent the whole body of the tube from flying apart, and thicker glass. But there is no guarentee it will always protect in all cases of tube breakage. Tubes made before the implosion protection standards were incorporated, such as in a set made in the 1950's or 60's, had no protection at all, and the glass was thinner, and those tubes were very dangerous to handle. A small bump or scratch on the tube could cause it to implode with disasterous effects to the person handling it. In any case it is most advisible to wear heavy clothing, gloves and eye protection when handling any picture tube. When disposing defunct CRT's it is important to let the air into it. This can be done safely by removing the base from the tube at the end of the neck and *carefully* crush the vacuum seal in the center of the circle of pins with a pair of pliers. Depending on the size of the tube the air will enter the tube for a several seconds or longer..when the hissing stops the air pressure inside and out

has balanced. and the tube will not implode if broken. I've had several years experience as a professional TV service tech, and have never had a tube break. I always treated them with care in handling them.

> > real thing would be best.
Only at NTP/STP. Quite temeperature dependant I think.
See Kaye and Labey - Laboratory Handbook or similar.

As Weston cells have a high internal impedance you could
easily use a resistive divider to get the 1.2V down to 1.01xxx.
A well designed piece of kit using a Weston cell will only draw
a few microamps from the cell, even when out of balance.

However you will still need a Weston cell in working order
to calibrate your voltage source, The 'precision' references
have excellent repeatability but their output voltage can
vary by several percent from one sample to another. Weston cells
don't vary from one to another and the variation vs temperature
is well known so you can get a voltage to an accuracy of less
than 1/10th of a percent very easily.

Hello. I have just acquired two large rolls of new thicknet cable. It is double shielded, approx. the same dia. as RG-8, 50 ohm, solid center conductor, and looks as if it would take up to 500-750 W with no problem. Has anyone used this in their setup? Since old thick ethernet runs @ 10 meg. I am assuming the losses at least to 14 MHz. to be tolerable. Will it be useable in the long run?

Thanks,
Randy. KB8ASO

That's not true of the MAX6190 and family - that's the whole point of recommending those.

The MAX6190A has sample-to-sample repeatability of 1.250V +/-2mV with no adjustment (none possible) and typical tempco of 5ppm/K = 6uV/K.

Are you sure this was a flashtube? I've got a couple of Xenon Short Arc
tubes
which have similar warnings. They mean it too, they've got Xenon
pressurized
to about 10 atmospheres in 'em and can explode sending serions shrapnel
all
over the place! They do make a hellaciously bright light though,
continuous,
not a flash. They use 'em in search lights, big movie projectors, spot
lights,
etc.

Except the criteria for "tolerable loss" would be relative to a receiver directly connected to the cable (when used on ethernet). I don't know what determines max-power handling specifically, but remember that this stuff normally gets used at miniscule power levels! I'd say it's optimized for noise rejection, not power handling.

T'would be interesting if someone could check it out with a cable tester, though. That stuff is definitely out of style and no doubt would be cheap.

Radio Shack has their copperclad scattered all around the site and it's hard to tell what you're getting. I couldn't find anything for $4.65, and what I could find I couldn't tell what is. Oh wait - there is is, but it's not under copperclad, it's listed under "KeproClad PC Boards":

FR-4 Unsens Copper Clad Board 4x6

$4.65
Cat.#: 910-1916

FR-4 Unsens Copper Clad Board 4x6

There are times where www.radioshack.com is cheaper than DigiKey, sometimes a LOT cheaper. On the other hand, most of the time they are higher.

The prices at www.radioshack.com seem entirely unrelated to the prices in the store.

The e.m.f. of a Weston cell should be 1.0183 volts at 20 deg. C.
At any other temperature Et = 1.0183[1-0.0000406(t-20)-0.00000095
(t-20)^2]. This according to Leonard B. Loeb in his book Fundamentals
of Electricity and Magnetism (1947).

Take a look at the National Semi LM399 thermally stabalized reference.
good to around 5ppm. it's a nominal 7 volt unit. Use Caddock or other 0.025
percent resistors to get it down to Standard Cell voltage 1.018907 or so .
Good luck.
Bob, KE6F

860. IF Transformer Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-13 00:00:00 UTC
From: Jim Bo <jbollit@ix.netcom.com>
Message-ID: <396EACF1.97F69DCC@ix.netcom.com>
Source record: 59385

Does anyone have an old IF Transformer (455 Khz) laying around
that they would part with?

The physical size of the IF can I am looking for is about 2
inches in height and has an adjustable hex core that takes
approx. a 1/8 inch adjustment hex tool.

I really need the slug inside the IF to replace one that
"disengrated" when I tried to adjust the coil in my radio.

If anyone has a couple of slugs that are approx 1/4 inch in
diameter with a hex adjustment, these would also fit the bill.

Thanks

Jim

> to 1.5Kw to 2Kw, but no less than 200W PEP..

If you have never built an amplifier before, start with a small one. To scale up an amplifier to the power level you are talking about would in general require paralleling a number of tubes. These tubes should be matched to carry the load current equally. Buying a matched set of 3 to 4 medium power tubes for a 1.5 to 2 KW power level can get expensive. Also the mechanical design can become messy too.

> I am contimplating using either tubes like any of the 3CX or 4CX series or
> similar tubes, but would even concider the low output tubes.

The 3CX series are easier to use than the 4CX series, which requires a well regulated screen supply, but requires more drive power. A few good, and cheap, tubes for HF amplifiers to experiment with are the 811A, 812A, and the 572B. Any of those three tubes will allow you to build an amplifier with up to 200 to 300 watts PEP output. A very good amplifier is outlined in detail at the URL below using the 572B for 350 watts PEP output.

Can anyone help me find the good design/drawing for the 23cm band microstrip panel antenna. I'd like to use four of these stacked for RX and four for TX on our local ATV repeater. Anyone?

Thanks in advance,
Vladimir YZ7REA

874. Relay wanted.

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-14 00:00:00 UTC
From: DUNCAN WALTERS <tesla@cwcom.net>
Message-ID: <396EDE72.39DA051B@cwcom.net>
Source record: 59390

Can anyone help?
I need to replace a plug-in relay in my Sommerkamp FT250 (Yaesu FT200)
transceiver.
It is a 4 pole changeover relay with a 12v DC 1000 Ohms coil.
Physical size is 29 mm high by 18 mm wide by 27 mm deep.
It has 4 horizontal rows of 3 tags. The coil tags are sited at one
end of the base.
Substitution with a relay having a lower coil resistance is not
practical
as it necessitates a higher current which the supply struggles to
provide.
Has anyone got one of these lurking about, or could someone suggest
a source?
Any help will be greatly appreciated.
Please reply soon.
Best regards,
Duncan G4DFV

There's the problem - it has low drift but it's only a "nominal" 7
volts. You then need a standard cell to determine how to divide it down.

As far as I know the MAX6190 family are the only ones that have *both* a
tightly specified initial voltage *and* low drift... and samples are
free, even to individual radio amateurs.

Message-ID: <20000714223210.20048.00000253@ng-fj1.aol.com>
Source record: 59306

Help!

I am looking for other Naval Academy graduates or US Naval personnel who can assist me in saving the amateur radio club at USNA.

I have been the officer rep for the past 2.5 years, but a decision was just made in the past 48 hours (over the summer while the mids are conveniently out at summer training or on leave) without notice or discussion, to disestablish the station W3ADO (also Navy MARS station NNN0NNN). Perceived lack of participation, lack of knowledge of our various missions and accomplishments ("oh, ham radio is dead..."), and funding probably played a role.

Mailing address for support letters:
Captain Sam Locklear, USN
Commandant of Midshipmen
101 Buchanan Road
US Naval Academy
Annapolis, MD 21402

cc me at:
Ryan "Skip" Johnson
510 Norton Lane
Arnold, MD 21012
k3for@aol.com
if you can

Or if you can't write a letter, please email me something and I will forward it to the Deputy Commandant by email.

Thank you ! I only hope its not too late -- I have to run down there and see if they've thrown out the gear already...

NEW: Pay 50% now, 50% after filing! You won't get THESE arrangements anywhere else!

We'll NEVER throw you that tired old line which states: "Payment in full must be received BEFORE services will be performed..."!

We are now accepting applicants for the second LPFM filing window. We will only accept a limited number of applicants for the second LPFM filing window. To be one of the clients for the second filing window (Connecticut, Illinois, Kansas, Michigan, Minnesota, Mississippi, Nevada, New Hampshire, Puerto Rico, Virginia, Wyoming), go to our credit card acceptance page or contact us by whatever method you prefer from our contact page.

Some lessons soon to be learned by LPFM applicants: At LEAST four of the applications which will be returned as "flawed" are from applicants who assured me, personally, that they "can file this application without having to pay for any technical help"... Looks like they fell into an NAB sponsored(?) "dis-information" trap...

hi

i need to transform 600 ohms balanced @ 432 mhz
into 50 ohms unbalanced. torroid baluns don't seen
realistic at this frequency.(tell me if i'm wrong, i've done
a bit of research on the net and haven't found torroids
that are rated much above 30 mhz). power will be less
than 50 watts. is there some magic(a length of coax perhaps)
that could do this for me?

Although you see them rather infrequently at this frequency, an antenna tuner could accomplish the transformation, with unbalanced 50 ohm input and balanced 600 ohm output.

For a fixed frequency, simply use a center-tapped coil. Around
2 uH should be about right.

how about a 300 ohm ladderline, with an appropriate length of 450 ohm
ladderline inserted to transform, and the 300 ohm connected to the tuner
at the transciever, this will have a lot less loss at uhf than coax.

The most simple solution would be to use a balun, and a Q section.

It's easy to construct a 1:4 balun with a 1/2 wl 50 ohm coaxial line
(see the Handbooks). That would give you 200 ohms.

An electrical 1/4 wl of what they call "450 ohm ladder line" with #14
or #16 conductors would be almost perfect for the Q section.

Go coax to balun, balun to Q sedction, Q section to antenna.

I'm have trouble finding PCB mount potentiometers. I need some 10K audio taper ones. I'm wondering if I can't find any could I use a regular one like a volume control or someting like it? The only ones I've been able to find have like 3 solder lugs on the top. Can I run wires from the lugs to the PCB and get the same effect as a PCB mount one?

Dose anyone know a source of PCB mount ones?

I'm feeling a complete idiot as I had clamped my copper radials to the base of my Butternut
HF6V vertical over a year ago.... I started to experience computer QRM when the thing
had been fine before, I investigated everything in the shack, eventually I checked the earthing
on the HF6V and found that the connections were covered in a white "toothpaste" film.
I then remembered my chemistry lessons re electronegativity and it all fell into place.

I've gone over to bonding copper to aluminium via a stainless steel interface and all is now
superb.... the receive noise level is down and the tx swr figures have improved (marginally)
eg: 1.7:1 reduced to 1.4:1 on 14MHz.

On this occasion, I don't mind making a fool of myself in public if its going to stop others having the same
experience..... I dread to think of the effect on a beam if the same thiing was done !

If it fits and has an audio taper, then use short flexible wires to
connect it to the board.

That would work, but...

1.) We still need a balun, and a sleeve-type balun is mechanically
more complex to construct than a simple coaxial delay line balun.

2.) The loss in several inches of almost any coax is negligable
compared to the loss in a long feedline or even in the antenna itself!

All in all, it would problem make no difference except mechanically it
would be a bit more complex to do a combo twinlead/balun or a 1/4 wl
sleeve balun.

Arcing plate tuning cap
Does anyone know of a method of increasing the breakdown voltage in
an air variable capacitor?
I've tried clear lacquer, That didn't seem to work to well.
Maybe someone knows of something they have tried or know of a product
that works.
Space limitations prevent any larger size of capacitor without
major work.
If the amp is tuned properly everything is sometimes ok but just a
little off and she will arc.
This amp has been modified from originally 811A's to 572Bs
running a plate voltage of around 2200 to 2300v
I suspect the plate var cap was overlooked during the upgrade

One thing worth checking - particularly if you have had arcs before - is the state of the capacitor plates. They should be smooth and without burrs. Any sharp point can concentrate the field and lead to a breakdown sooner than would be expected from the plate spacing alone. You might also calculate the peak voltage across the cap and compare to the air gap - ARRL Handbook has tables giving breakdown voltage as a function of spacing.

Unfortunately I think you're stuck, there is no way to raise the breakdown voltage spec. on an air variable. Keep it clean but that's about it.

Hi Larry,
Are you stuck with 600 Ohms? Seems quite high. If you can get to 200 Ohms, either a hairpin match or a 4:1 coaxial voltage balun will do nicely.

where is the balun needed, there is no unbalanced situation, a dipole
antenna, balanced line, both the 300 and 450, all the way to the tuner.
the tuner will balun the coax from the tuner to the txciever.

When threads get long. we often don't read the original question.

He was asking about a 432 MHz radio. That rules out an antenna tuner.

Hairpin matches are too critical on 432 MHz, and a coaxial 4:1 balun
at 600 ohms output (150 ohms input) is unreasonable.

In addition to ensuring that the plates are clean and free of burrs, etc, also make sure that your match to the antenna is as flat as possible..the higher the SWR, the more reflected RF voltages are kicked back into the PA circuit or cannot leave it. Start out with lowered power when tuning the antenna tuner, tune for minimum SWR, then gradually increase power and fine-tune the antenna tuner if necessary. Also, if the loading capacitor is too tight (plates more meshed than they should be) the RF can arc across the plate tuning cap, since much of it will have nowhere to go. :-)

Source record: 59402

Leland,

Thanks for the help. I have had experience with amplifiers in the 50 to 200W range, but never really built any completely by myself. I've heard that the there were good tubes to use in amplifiers starting in the early 1950's. I have all of the ARRL Handbooks from 1950 to 1960.

I have also built a "seperates" reciver and transmitter using some tubes from the following selection. Most of these I already had in my collection

6AG7, 6AG5, 6AX5GT, 6AK6, 6BE6, 6AQ5, 6SK7, 5Y3GT, 5Y3, 6BD6, 807, 5U4G, 5V4G, 5763, 6146, 6X5GT, 6N7, 816, 6Y6G, 0A3/VR75, 0D3/VR150, 813, 6V6, 866 5Z3, 6L6, 2E26, 6C4, 4-250A, 6BA7, 6K8, 6SA7, 7Q7, 6SB7Y, 6AC7, 6AK5, 7F8 6J6, 12AT7, 6AB7, 6AC7, 6AK5, 6AU6, 6BA6, 6BH6, 6BJ6, 6J7, 6K7, 6SG7, 6SJ7 6SH7, 6SJ7, 6SK7, 7G7/1232, 7H7, 6H6, 6AL5, 6L7, 6G5, 6N5, 6AD6G, 6E5, 6AC7 6AK5, 6SG7, 6J4, 6J6, 7F8, 6SN7, 80, 6SA7, 6K8, 6SB7Y, 12AX7, 6AK5, 6BA7, 12AU7, 6AR5

I used a chassis similar to size the Hallicrafters HT-20 from 1953 or the Collins 75A-2 / 75A-3, 32V-3. All RF connections outside the ecquipment are of Amphenol brand. Transmission lines are Mil- Spec quality Belden wire No's 8239 through 8241. Though my desgins never exceeded 350 watts. I used good quality Millen , EF Johnson and B&W parts and some other parts I've gotten since 1988 at local hamfests.

For years I have been trying to find RCA tubes of the following:

5762, 2E26, 807, 6146, 829B, 811-A, 812-A, 4-65A, 4-125A/4D21, 813, 810, 833-A, 4-250A/5D22, 5R5GY, 816, 866A.

Thanks for the link. I have printed a copy and added it to my notes for the future.

Let me know if you think any of these tubes and/or specific tube combintations of these tubes work really well for amplifiers

Gregory Bowne.

928. RCA AM transmitters

Newsgroup: rec.radio.amateur.homebrew

Message-ID: <uxu8Ih67$GA.293@cpmsnbbsa09>
Source record: 59403

I have an interesting chance to purchase some nice RCA AM transmitters from the 1940's to 1950's (and possibly earlier) in various stages of completeness very, very cheaply before they are broken up for parts and surplus.

First of all, does anyone know what models were made in that era and can give me the numbers and data?

I need manuals ; i.e. ; Parts, service, mainenance, owners, installation, etc.

Are original parts and tubes still available? If anyone has anything that will work with these transmitters email me with what you have and prices.

They will be made to go back on air by a local non profit AM radio station.

Thanks,
Gregory Bowne

Steve ,if you can find some Teflon sheets,thin(,like paper thin). cut the sheets same size as cap plates,slip the sheets in the spaces where the arcind is taking place ..you may stop by an electric motor shop and get some sheet insulation that would do the job also..putting insulation between the plates also changes the capacitor dielectric and increases the actual capacitance which might be a problem on 10 meters ..good luck Harold W4PQW

>source something like this.
>

Look in old Ph meters/thermocouple potentiometers. They used to contain
Weston cells. However if you find one in nice condition you'll probably
want to keep it too. There are plenty of battered ones around. Another
likely source is a friendly school lab. They all seemed to have them
at one point for demonstrating how to calibrate meters. However since they
contain mercury and cadmium, and aren't on the syllabus, some schools have
relagated them to the back of a cupboard.
The Cambridge instrument co. made a round black metal tub containing
two Weston Cells. It turns up fairly often (I've certainly got one or
two at home).

You might try teflon sheet made to cover a cookie pan, I've used it for it's non stick properties but it may work well for insulation. It comes in a sheet about 12" x16"
You could also try mylar sold in blueprint or copy shops..

> that the there were good tubes to use in amplifiers starting in the early
> 1950's. I have all of the ARRL Handbooks from 1950 to 1960.

The 1968 Handbook has plans for a simple multiband HF amplifier using one
811A tube for 200 watts PEP output. I also know that Ameritron uses four
811A's in parallel for around 800 watts PEP output in their amplifier model
AL-811H.

http://www.ameritron.com/ameritron/products/ttamps/al811h.html

A good place to find parts for tube, or solid state amplifiers is RF Parts
Company. They can sell you a matched set of tubes at a reasonable cost. The
cheapest tube to use is the 811A, and they are still produced by several
companies. If you can't find the 811A you can substitute the 812A for it
normally.

Source record: 59411

Hi all

Firstly, does anyone have good reference sites for DSP demodulation of FM, SSB, CW etc? I have only found a lot dealing with CW filtering.

Secondly, does anybody know where I can find a button kit for the FT-80C which is a commercial version of the FT- 747? The buttons a ham needs the most are all blanked off on the 80C. Unfortunately the local Yaesu agent went bust some time ago which is a pity because they used to be able to get hold of them at one stage.

Kind Regards
Craig

Can't help you on the Yaesu question, but for DSP stuff, _Digital
Signal Processing in Communication Systems_ by Frerking is a useful
place to start. I've found _Communication Systems_ by Haykin to
provide useful background.

I know books are quaint and terribly old-fashioned, but there is
still a time and a place for them. And this is one of them.

Source record: 59414

Seems like a good idea but was hoping for a spray
This capacitor is the kind that has no stops on it.
It will spin all the way around and around.
On a side note, I've found the filament volts to be at 6.9 to 7volts
at the tube base, I just put in 4 matched Svetlana 572B's
The pdf file on these tubes calls for 6.3 + - .3
This amp had come with most of the notes on work done to it over the
years from 1977 (4 sets of tubes are documented)Maybe thats not real
bad, Just depends on how much use it got. Tubes I put in are not
included in the count of 4.
I put these in cause 2 of the china tubes in there broke during
shipment of the amp, Tubes looked fine except for the getter flash
turned white and open filiments. I also noticed more then a 1/4 inch
height differance in those china tubes.
Had a filament choke that I had made for another project that never
came about, So I added that as just a dropping resistor.
Now have 6.3 v at the tube base.
I think I'm seeing a slightly reduced out put and less trouble with
arcing. Seems now to be under a 1kw out
That would be a little more what I would expect from a quad of 572B's
when driving them with a 100 watts from a yaesu ft 847 ???
Guess the truth is I really don't know what to expect with a quad of
these tubes, The pdf file says 50w drive at 300w single tone out per
tube

All my tuning has been into a dummy load as the amp has only been put
on the air for the first time by me a few days ago on 40meters cw, Had
good on air report
please see my response to W4PQW for more updated info

Please correct me if I'm wrong
But I think high swr will have a minimal effect on the plate tune
capacitor But will certinly nail the loading capacitor, I always
beleived that reflected energy can be sent back out of a pi network,
Minus feed line loss

This was what the project called for. It is used to make some VHF coils in the transmitter side of a transverter. I would think that since it specifies silver, it must have something to do with the conductivity of the wire. Anyway, I think I have found some. A fellow had some in a radio repair shop at the company where I retired from.

Leland,

Thanks for the information and help. I have heard of and am going
to try using R.F. Parts when I go to build this amp.

I do have parts accounts with Mouser and a few other suppliers too,
so access to parts and parts information / technical information is never
more than two phone calls away.

I can get a copy of anything from 1960 onwards at the library in
downtown Seattle, WA. I only have 1950 to 1960. Those were given to me by
an OM at a 'fest few years back. I also have friends that have copies of
'70's to '90's handbooks that I can borrow for a short duration, or make
copies of arcticles. I have seen earlier editions (1949 and earlier) of
the handbook on microfilm at an electronics info archive somewhere in CA.
It would be nice if ARRL used Adobe Acrobat to scan and .PDF the pages of
the majority of the available editions and make CD-ROM's to sell to willing
Hams that need the Tech info from years past.

One of the projects I've had was to trace the companies advertised
in all of the 1950's editions so see which ones are left, etc. etc. etc.

Anyhow, back to the old iron...

:>>>an air variable capacitor?

Yes. Put it in a glass jar filled with mineral oil.
Orient so both rotor and stator stays immersed as the
cap is tuned.
This will increase the max C about 3+ times
and increase the Vbreakdown about the same.

Message-ID: <8l1287hdd1@news.hawaii.edu>
Source record: 59431
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

At HF the skin resistance of silver is about 5 percent lower than
copper. The same inconsequential reduction can be achieved with copper
just by increasing the conductor diameter by 5 percent.

The silver specification has something to do with successive
repetitions of nice-sounding old wive's tales.

Unfortunately the AD web site doesn't take orders from non-US/Canada customers. The ADI webmaster tells me that this will be rectified in the future.

The nice people at AD have been very helpful in trying to get me a couple of these chips.

BTW, the 9856 is a digital up-converter - looks like DDS to me. Program it correctly and out pops a sine wave - DC to 80 MHz output bandwidth. For the homebuilder who doesn't mind small leads on IC's, it looks almost perfect as an LO or even as a VFO in a direct conversion receiver.

Source record: 59436

Hi -
It seems that EVERYONE is getting about $1195 for the TDS210
scope currently. Does anyone know where you can get the BEST price?
Of course I want one of the plug-in interface modules also..

By the way, the price difference between the TDS210 & 220 seems out of
line. What warrants the price difference (other than consumer demand)?

Thanks. - Jim

Mike,

This sounds like the 11-Pin round plug/socket used on the
back of many Heath rigs. About a year ago, a friend of mine
bought a SB-101 at a swap meet and a power supply seperately.
The plug on the supply was wrong but I was able to obtain
the required 11-Pin plug at "Antique Electronic Supply",
"http://www.tubesandmore.com/".

At that time, it was the only one they had on hand. They
should have more by now. They only charged $2.00 for it.

It is not illegal to modify the radio. Only to transmit on unauthorized frequencies. Just as a General class operator in the US can own an HF transciever which is capable of transmitting on frequencies that are not allowed by the license class. Of course, there is the question of "why do you want your radio to be able to transmit on frequencies that you will NEVER have priviledges for?", but ours is not to question why, ours os to have control of our equipment rather than having the manufacturer do our thinking for us!

Glenn,
Your music will always be with us but I thought you perished on Dec.15,1944?
Glad to see you're still here.

You know what the public doesn't know about you that I do because I've been
a fan of yours since I was 10 years old; that was in 1948? And by the way I
was raised in Passaic, New Jersey and your very last stateside concert was
in the Capitol Theater on Central Avenue, Passaic, Sept.28, 1942.

People don't realize that you failed Freshman music composition at the
University of Colorado. And what did you have to do to be re-instated the
next Fall? Compose something that would grab the fancy of the directors of
the School of Music.

What you composed not only got you re-instated, was phenomenal but also
will be around as long as pop music itself. In fact it became your signature
tune. "Moonlight Serenade." Damn, you're a genius Mr. Miller.

I found out lot about you for two reasons. I have read several biographies
and even corresponded with David MacKay who used to be the executor of your
estate. Secondly a distant, now deceased cousin of mine, Wilbur Schwartz,
told me much when we met in 1982. You remember Wil, don't you? He played sax
in your Stateside orchestra, right next to Tex Beneke and worked with Jerry
Gray in arranging one of your masterpieces and the biggest selling
instrumental in the history of American music-"In the Mood." You gave cousin
Wilbur a big mention in the movie "The Glenn Miller Story" with Jimmy
Stewart as you. In fact you credited Wil for giving you that special unique
mellow sound for which you were searching for decades.

Glenn Miller-you're in a league of your own.
Doc,AF2Y

Does anyone know what the difference between a normal ceramic capacitor and an "NPO" capacitor is? I am curious because in the kit I am making at the moment there isn't really enough NPO caps supplied to fit the parts list and since I can't find 'NPO' capacitors at any nearby electronics shop I have just interchanged normal ceramic capacitors in their place. Does anyone think this will affect the sets performance drastically?

>
> The MAX6190A has sample-to-sample repeatability of 1.250V +/-2mV with no
> adjustment (none possible) and typical tempco of 5ppm/K = 6uV/K.

+/- 2mV is still nowhere near as good as a Weston cell. It is +/- 0.16%
so
you really don't need high precision resistors. Certainly not good
enough
to calibrate even a 3 1/2 digit voltmeter let alone 4 digits. A Weston
cell is at least an order of magnitude better, two orders with care. No
lab
required, just a thermometer and a bridge.

see the message from Tom Donaly in this thread.

The e.m.f. of a Weston cell should be 1.0183 volts at 20 deg. C.
At any other temperature Et = 1.0183[1-0.0000406(t-20)-0.00000095
(t-20)^2]. This according to Leonard B. Loeb in his book
Fundamentals
of Electricity and Magnetism (1947).

Source record: 59251

kent_i@fnmail.COM (Kent Inverarity)
shared these priceless pearls of wisdom:

->Does anyone know what the difference between a normal ceramic capacitor and
->an "NPO" capacitor is?

First you have to define "normal". If "normal" means a general purpose capacitor with no special temperature coefficient, then the difference is that an NPO comes as close as we can get to a disk ceramic capacitor whose value stays very close to the room temperature value over extremes of temperature. The "NPO" was originally coined from the temperature coefficients "Negative Positive Zero".

To expound just a LITTLE further, there are capacitors produced with a lot of different temperature coefficients - N750 (Minus 750 parts per million per degree C change), N1500, P100, and so on. Generally coils have a POSITIVE temperature coefficient (the value increases with an increase in temperature). By using a NEGATIVE tempco capacitor, the resonant frequency can be kept close to the room temperature value over extremes of temperature. N750 is generally a pretty good place to start for garden variety LC combinations. Of course, for specialized applications, you can make any tempco you want with a judicious series or parallel combination of NPO and Nxxx.

It is also true that the ceramic dielectric of an NPO (or any Nxxx or Pxxx) capacitor is quite good from a "Q" point of view. While not quite as good as the little porcelain microwave SMD capacitors meant for high power amplifiers, at VHF and below an NPO capacitor can approximate the Q of a good mica or polystyrene capacitor.

...and a Weston cell.

Robin's original question was what to do about a missing Weston cell for an older-generation instrument. We already established that the cell manufacturer is long defunct, so the chances of getting a true replacement are nil. That left the options of either making his own Weston cell or finding something else.

It's also worth considering that that instrument couldn't actually make use of the full accuracy that a Weston cell can provide. The reason it used one was because, beck then, the Weston cell was probably the *only* transportable accurate voltage source available.

This is all fine and true if your "sub-hobby" is precision test equipment (please don't get me wrong - I have some sympathy with this). However, for voltage measurements in practical RF electronics, it's most unusual to need an absolute accuracy better than 1%. Better resolution, well yes, occasionally; but better absolute accuracy, hardly ever.

Hi All,
Listed below is all my gear for sale. Anyone Interested let me now by email.

Icom IC706 MkI (Mint) with seperation kit, mounting bracket and bracket for mounting the face, books, boxes, cables etc. Comes with CF-706 duplexer (1.3 to 57 mhz/ 75 to 320 mhz), Plug In tunning modual, Seperate DC Cable with EMC filter (Icom OPC-639), Outbacker Perthplus mobile Antenna with mount, Vectronics VC300D Digital bargraph ATU (NEW), Jaybeam 10, 15 and 20 Dipole, Kenwood LF 30 A Low pass filter, Diamond SX-400 SWR/Power meter, Maplins 7amp power supply, 40 Mtr helical wound mobile whip, kenwood TM241E "mtr VHF mobile radio, MFJ-1278 TNC, VHF (sandpiper) 2/70cms vertical antenna, SMC-517L10 (same as Yaesu FT23R) VHF handset, Paddle key, Antenna switch and a MFJ 249 Analizer.

All the above (main Items) are boxes with manuals and are In very good condition and In current use. Willing to demonstarte all the above working 100%.

Selling due to amateur bordom.

Serious prices for all of the above as a job lot, not willing to sell seperaly.

Email with questions.

Regards,

Brian James (gw0wgw)

A Mathcad plot of this formula shows a 0.5 millivolt change between 20 C and 30 C. This is 0.0049% per degree C. How does this compare with the chips?

I've only just come across this thread. Is someone looking for a
Weston cell? I have just found one in the "junk box"! Whoever wanted
it can have it for the price of the postage (guess around 50 UK
pence).

It measures 9cm long by 2.2cm square. Calibrated 1.01859 volts (and it
checked out on my DVM OK). The cell type number is D-550-A.

Hope this is of help..

email me, Peter, G3PHO at: g3pho@qsl.net
ansd we can proceed from there.

Peter.

Check the National Semiconductor web site, or a NS Linear 3 book. They make a 3
and 6 channel transmitter and receiver chip, and have application notes to
cover them, including a PC layout as I recall.

That's (er, counts on fingers) 49ppm/deg. The MAX6190A is temperature
compensated to 2ppm/deg typical, 5ppm max.

However, I'm only too pleased to retract that statement about "nil"
chance of finding a genuine replacement Weston cell!

Oh gawd, I didn't mean to start this sort of discussion off.

The electronic multimeter that I am servicing isn't capable of reading to the accuracy that a weston cell can deliver, it is an analogue one. So, an electronic equivalent would do quite nicely.

The meter itself only uses 1% resistors in the dividing chain for voltage so most of the acceptable electronic standards would do for this as the meter's inherent tolerance is greater than the mismatch between the electronic standard and the Weston cell, therefore making the electronic standard a good match.

I also had the idea that if this worked then as there are a number of CT471s coming on to the market through Birket's and the like then something that would replace the Weston cell would be an interesting thing for those people buying such sets.

Now, having defended the electronic route I will now stand it on its head :-).

It is true that the Weston Cell approach would interested me for two reasons.

1) It is what the meter was designed to take, which was, as has been pointed out, the only commercially available type of reference voltage for such an application that was available when the meter was manufactured.
2) A Weston cell will be more accurate than any electronic reference.

So, even though I might find a Weston Cell to replace the damaged one in my meter I may well build an electronic one as well for the reasons outlined above.

I must say thank you for all of the advice and input that has been sent my way as I had forgotten entirely all I ever knew about standard cells (Mind Wipe after A level physics) and thank you for the introduction to the electronic standards which is an area which I had never looked at before.

Regards

Robin

> I am looking for the calculations (e.g. 234/fmhz) for the spacing,
> Director, DrivenElement, Reflector, etc for a 3 element yagi.

Drew:

There is no one single design for yagis, so there is no formula you can follow. Roughly, the reflector and director elements are spaced .1 to .25 wavelength from the from the driven element. Different spacings result in different radiation patterns, different feedpoint impedance, etc.

There are a number of proven designs that have well documented performance that you may wish to use as a basis for your yagi. When building a yagi that someone else has gone to the trouble of optimizing, you should follow their design in all details, including boom length, element spacing, element length, boom material and diameter, manner of mounting the elements to the boom...etc...Any deviation from the original, optimized and proven design, will certainly result in poorer performance.

You best bet for proven designs is a book on the subject, such as the ARRL antenna books and the Radio Amateurs Handbook. There are a number of non-ARRL publications on antennas also.

You can find a lot of good info on antennas at
http://www.ac6v.com/pageant.html

1000. COLLINS FILTER ID?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-20 00:00:00 UTC
From: john williams <ac6ts@n2.net>
Message-ID: <3976FC0A.82527F55@n2.net>
Source record: 59274

Group,

I have a unused Collins Mechanical filter and need some help with finding it's properties, (what freq, use, etc.). The model number is "F
455 Y 21 6827" . Other number is 526 9337 00. Can anybody tell me how to
read the numbers? I think F 455=freq 455kc but I don't have a clue to the rest.

Also I have a large cylindrical one with a concentric mounting flange.
Prox 1/2" dia. and 2-3" long. No numbers at all. I have no equiptment to
find what these are.

Thank you for any help or resources where I can find this info.

1001. FM Radio Card Details

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-20 00:00:00 UTC
From: wb9whi@aol.com.ham
Message-ID: <20000720105221.13513.00001462@ng-cp1.aol.com>
Source record: 59275

Yow! I'm famous! I guess I'll have to read this group more often! Since the original post, drivers for these beasties have been put into the Linux Kernel sourcecode. Here's the orginal post:

FM Radio Card Details

Part 1: The Hardware
I have noticed several brands of FM Radio Cards on the market in the past few years. Until they went below $20.00 each, I didn't see much point. When Tom, N9UDL pointed out that there was a Linux Driver available with Source Code, I couldn't resist. I went to the Local Wal-Mart and picked up a Reveal RA300 card. I found a TEA5712T Am/FM receiver chip on it, and a Sanyo LM7000 AM/FM Frequency Synthesizer as well as a few other chips of lesser interest. This board has a Audio Amplifier which will drive 8 ohm speakers and a software controlled volume control. Best Buy is now selling an identical board under the
name Aims Labs. The card is called "RadioTrack!". These cards have a base address of 30F Hex or 20F hex, with 30C Hex being the default. The control address is actually 30f Hex or 20F Hex, 30F being the default.

Recently, Surplus Direct has been selling a Packard Bell radio card for around $12, or $9.88 over the web. While this card is no longer available, there doubtless have been quite a number given as gifts over the holidays and there are probably a few hams who are wondering what to do with them. These cards have a base addresses of either 358 Hex are 350 Hex, 358 Hex being the default.

These cards also have a Philips TEA5712T AM/FM receiver chip, and a Sanyo LM7001
AM/FM Frequency Synthesizer chip. These cards have neither a volume control nor
a power amplifier; these functions either must be provided by the sound card, or some other means of amplification. These cards were meant to be used in Packard Bell computers with a connector to a Packard Bell Sound Card. It hooks

to the Modem port on the sound card of my HP Pavilion perfectly. I can't hear the Modem connect while it's hooked up, of course.

Both of the Data Sheets for the Receiver and the Frequency Synthesizer chip are

available on the web in Adobe Acrobat format. The Receiver chip is available at
http://www.semiconductor.philips.com. The Synthesizer chip data sheet is available
at http://www.semic.sanyo.co.jp/english/catalog/index-e.html The receiver chip of
both types of cards has a VCO tunable by a varactor diode and air-wound coil,

and
an IF stage consisting of two ceramic filters. According to the data sheet, the
input and output impedances of these stages is 330 Ohms. All of the narrower filters
I found seem to have a much higher impedance. The cards seems to have a stock
bandwidth of around 200 kHz. There is also a signal strength pin, which yields
a voltage between zero and five volts. The pin is at zero volts when the signal
is at full strength, and at five volts when there is no signal present. This is
an analog output - you may attach a voltmeter or a meter movement with an
appropriate series resistor (the resistor value depends on the full scale
current of the meter). I used a small dB meter movement and a 3.3 K resistor.

These cards use +5 Volts, +12 Volts and I/O addresses - neither RAM, IRQs nor
DMAs are used.

Tuning the cards outside the Broadcast band:
Tuning the cards outside the band means adjusting the Local Oscillator coil on
the Receiver chip. I have experimented with this on the Packard Bell card. The
data sheet says the Synthesizer should go to 130 MHz max. This means it should

receive up to 140.7 MHz max. To my surprise, I was able to tune the card
all the way up to 162.55 MHz. The tuning voltage on the Packard Bell card can
be measured quite conveniently by connecting an ordinary VOM between the two
header pins next to the receiver chip and ground. The card will receive when
the tuning voltage is between zero and about nine volts. To extend
this range, the coil can be tuned or changed. On both cards the VCO coil is the
one most toward the front of the computer, or farthest away from the real plate.
I found three turns around a 3/16 inch drill bit will tune to 162.55 MHz and ten
turns around a 1/4x20 bolt (wind the wire in the threads of the bolt, then
remove the bolt) will tune down to 65.75 MHz. Some tuning can be done by
spreading the turns of the coil apart from each other, spreading the end turns
all the way until they are resting flat onto the card. Please note: The only
way to know if you have tuned the card outside the VCO range is to monitor the
tuning voltage and/or to listen. Once you've reached one of the limits, the
receiver stays at that maximum or minimum frequency - it won't go any farther.

When you go too low, tuning simply stops. When you go too high, you will enter

a range that has a weird warbling hum as the VCO voltage climbs to approximately
9 volts.

Part 2: Programming the Cards
All programming information has been taken from the Sanyo LM700x data sheets

and
the Linux Driver website for the Reveal RA300 radio card at
http://www.cs.ucr.edu/~quay/notebook/node4.html, possibly no longer available.
The information on the Packard Bell card was then found by experimentation and
with
the use of an ohmmeter. Tuning both cards involve sending 98 bytes of data to
the card. This may seem excessive until you realize how the cards are
interfaced. The LM700x chip has a three wire serial interface, one is the data

line, one is the clock line and one is an "active high" enable line - each
connected to one line of the data bus. The chip takes 24 bits of serial
information. To strobe the bits in, the clock line is brought low, then high,
while the data bit is held constant. This accounts for 48 bytes - two for each

data bit. Since the LM700x has a setup and hold time of 1.5 microseconds, each

byte is sent twice in order to slow down the data enough to be accepted by the
Synthesizer chip. Two bytes are sent at the end to bring the enable bit low
and
thus latch in the frequency. The catch is that these bits are assigned
to different bits on the different brands of cards. The Reveal and Aims Labs
cards are essentially the same, but the Packard Bell card uses different bits.

The Reveal/Aims Labs cards have the following bit assignments:

Bit Function
---
0 Enable (Hold high until all bits are clocked in)
1 Clock (Data is clocked in on rising edge)
2 Data
3 Radio On/Off
4 Tie Low
5 Tie Low
6 Volume Down (Active Low for 200mS)
7 Volume Up (Active Low for 200mS)

The Packard Bell cards are slightly different:
Bit Function
---
0 Radio On/Off
1 Enable (Hold high until all bits are clocked in)
2 Unknown/Tie High
3 Unused - not connected
4 Unused - not connected
5 Unused - not connected
6 Clock (Data is clocked in on rising edge)
7 Data

The Serial Data Format sent to the "Data" bit is as follows:
Bit Function
---
0 Synthesizer setting bit 0 (Least Significant Bit)

1 Synthesizer setting bit 1
2 Synthesizer setting bit 2
3 Synthesizer setting bit 3
4 Synthesizer setting bit 4
5 Synthesizer setting bit 5
6 Synthesizer setting bit 6
7 Synthesizer setting bit 7
8 Synthesizer setting bit 8
9 Synthesizer setting bit 9
10 Synthesizer setting bit 10
11 Synthesizer setting bit 11
12 Synthesizer setting bit 12
13 Synthesizer setting bit 13 (Most Significant Bit)
14 Test Bit (Always 0)
15 Test Bit (Always 0)
16 Band Data 0 (Always 0)
17 Band Data 1 (Always 0)
18 Band Data 2 (Always 0)
19 Time base Data (Always 0)
20 Spacing Mode 0 (Use 0 for 25 kHz and 100kHz spacing)
21 Spacing Mode 1 (Use 1 for 25 kHz and 0 for 100kHz spacing)
22 Spacing Mode 2 (Use 0 for 25 kHz and 100kHz spacing)
23 FM or AM Synthesizer input pin (FM=1/AM=0) Always 1.

Bit 0 is sent first and bit 23 last. This holds for all cards using the LM700x

chips.

To obtain the setting, take the frequency in MHz, adding or subtracting the IF frequency (depending on what VCO range you want to use for what range of frequencies), divide the result by 0.025 and change to an integer. Send the resulting number serially to the proper bit of the proper address, making certain to send exactly 14 bits. Then send the remaining bits, drop the enable

line, and possibly set the bit to turn the radio on. Three spacing settings are

available for the FM synthesizer: 25kHz, 50 kHz and 100 kHz. It may be possible
to divide the crystal down and obtain more resolution by feeding the result into
the XIN pin of the LM700x chip, but I haven't had time to try this.

Part 3: The Bench Jig
Both types of cards use an 8 bit ISA slot. The connections are labeled A1 to A31 and B1 to B31. A1 and B1 are at the rear of the computer, next to the back

plate. Facing the back plate, A1 is on the left and B1 is on the right. Rotating the back plate to the right, A31 is on the left and A1 is on the right.
Rotating the card so that the Back Plate is on the left, B1 is on the left and B31 is on the right. The Packard Bell card uses only 20 of the 62 fingers in the 8 bit slot connector, the rest being non-existent. The Aims Labs cards

uses
22 fingers in the connector, the rest being non-existent.

Here are the connections for the jig:
PIN Description
A2 Data bit 7
A3 Data Bit 6
A4 Data Bit 5
A5 Data Bit 4
A6 Data Bit 3
A7 Data Bit 2
A8 Data Bit 1
A9 Data Bit 0
A11 Address Enable (Tie High through a 10k resistor to +5V)
A22 Address bit 9
A23 Address bit 8
A24 Address bit 7
A23 Address bit 6
A26 Address bit 5
A27 Address bit 4
A28 Address bit 3
A29 Address bit 2
A30 Address bit 1
A31 Address bit 0

B1 Ground
B2 Reset (Normally low, pull high to reset card)
B3 +5V (Where used)
B9 +12V
B10 Ground (Where used)
B13 I/O Write
B14 I/O Read (Tie high through 10k resistor)
B29 +5V
B31 Ground

The jig consists of connecting the data lines of the parallel port to the data lines of the radio card. Tie the address lines to the control address of the card (e.g. 20F Hex). Tie the STROBE line (DB-25 pin 1) to the I/OW pin (B13).

Ground the BUSY and PAPER Out lines of the parallel port (pins 11 and 12). Ground the serial port (DB-25 Pins 18-24 and sometimes 25). Supply +5V and +12V, bypassing with 0.1 uF capacitors, modify the software to write to the parallel port instead of the slot address and you're done. I have not tested how carefully the power supplies to these cards need to be regulated.

I hope some of you find this information as useful and as interesting as I have.
It accounts for nine months of experimenting. Use this data at you own risk, just in case I have made some mistakes, or something is less than clear. Soldering almost certainly invalidates the warranty.

There are many possibilities for these cards. My next project is to try to build the Packard Bell cards into a car stereo that will receive the amateur bands. Any questions or comments are welcome.

"If you build it, they will cannibalize"

According to Loeb, using a precision potentiomer, a galvanometer,
and a standard cell it was possible, at the time he wrote, to measure
an unknown potential difference to an accuracy of .01%. The
temperature fluctuation of the standard cell wasn't a big issue

because it could always be accounted for with a formula. I don't expect many people would want to use such methods now, but it's interesting to find out how things were done in the past, if for no other reason than to be able to feel smug about the present.

Tom Donaly KA6RUH

(P.S. I hate to sound like someone's grandmother, but everyone should be aware that Weston cells, because of their mercury content, pose an environmental risk.)

My first exposure to DSOs was five years ago; a client had a lot of
Tektronix DSOs in use. I expected the worst but fell in love with them.
They had mostly bench types, but I got to play with one of their Tek
portable units as well. They have a lot of advantages; traces don't get
super-dim at the upper bandwidth limits; capturing transients, or even
just random samples of a waveform, is blessedly easy; on and on.

There are situations where an "analog" scope is much better suited, but
for general use the DSOs are great. (I've never seen a DPO.) For example,
if all you want to do is *detect* a transient, digital works well; but
to actually *measure* it accurately can be difficult under some situations.

If I had to choose which to buy new, I'd get the digital scope and pick
up a used analog for those special situations. I'd own a digital scope
now if I could justify the cost. Perhaps when I have more toy money...

1008. radio kit

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-20 00:00:00 UTC
From: "Clifton T. Sharp Jr." <clifto@clifto.com>
Message-ID: <39773CBA.44832A9E@clifto.com>
Source record: 59282

Yesterday I picked up an AM/SW radio kit at Radio Shack for just under $7.
I mainly bought it for the nice, long 4-3/4" ferrite rod, but last night I
looked at the box and it looked at me and I knew I had to try building it.

Despite the aggravation of inserting 33 springs into 33 holes and then
having to get wires jammed into the springs, I have to say I got a kick
out of hearing strong local stations on it when I got it together. It's
nothing more (in AM wiring configuration) than a tuned circuit, diode
detector and two cascaded audio amps.

I've been putting together kits since I blew up the filter caps in a Knight
T-60 at age 14. I spent weeks cobbling together a Wersi Delta organ and
troubleshooting it to the component level (got a couple of bad DACs).
Still, there's just something about hacking pieces together with your
hands and having the result actually do something, even to the point of
"springing" together a few simple components to pump a crystal-set quality
signal through an audio amp into an earphone.

Tektronix TDS 210. Cheapest standalone digital scope I know about.
Rated for 60 MHz bandwidth, but rise time measurements suggest that
mine is really about 80 MHz. (There's also a 100 MHz model at a much
higher price). Samples at 1 GHz on both channels simultaneously, so
it captures plenty of samples to resolve the waveform of anything
that is within its bandwidth. If you want to get the data into a
computer, there is a plugin serial interface - also allows complete
control of the scope from an application on the computer.

There are time and voltage measurement cursors, plus automatic
measurements of period, frequency, one-cycle RMS voltage, etc.
An optional plugin module provides realtime FFT (not cheap though).

It's more expensive than a typical "PC scope", but its performance is
far far higher than a typical PC scope (look at PC scope bandwidth and
sample rate specs). And you don't need a PC to use it. It's also
much smaller lighter and more portable than a CRT scope, though not
as small or light as a Scopemeter (but not nearly as expensive either).

Since I bought one, I haven't used my analog scope.

Hi Reg,
I live within a mile of San Francisco Bay. Due to the
presence of natural and man-made sources, I can eat all
the mercury I want just by eating the fish that swim in the
bay. Of course I could get more by pouring the contents of
a bunch of old Weston cells into the water, but why be greedy?

Will this not greatly increase the loss of the cap? Not a good idea in
an antenna tuner.

Ian.

Bill, I get 0.4 mV using an HP-11C hand calculator. Picky, picky, picky! It's still good enough to calibrate my 3-1/2 digit DVM.

More important, I remember reading a dissertation on the Weston cell which stated that the voltage could not be considered accurate if the cell were older than 10 years. Since it is doubtful that any usually available are less than 10 years old...

It is unfortunate that mercury cells are no longer available. The R-suffix on the part number indicated that it was a "reference" cell, and was a perfectly acceptable calibration standard.

There are some places where the NPO is important to have. In general,
NPOs would only be specified fof such applications. The NPO
designation has now been superceeded by the COG designation which you
may have better luck buying. As I understand it they are the same
thing. Who knows why "they" decided to change....

Source record: 59291

A large number of dielectrics are used in the manufacture of ceramic capacitors, and each has distinct characteristics, so there's no such thing as an "ordinary" capacitor. The main feature of an NPO capacitor is that it has a very low temperature coefficient (that is, its capacitance changes very little with temperature). A garden variety NPO capacitor (C0G) has a temperature coefficient of +/- 30 ppm/degree C maximum, or 0.003 percent per degree C. By contrast, a capacitor with Z5U dielectric, commonly used for bypassing, can vary +22,-56% from +10 to +85 degree C, an average of more than one percent per degree C. NPO capacitors are essential for applications like VFO tank circuits, and might be required for narrow filters. If you replaced a VFO tank capacitor with a Z5U, you'd have the driftiest VFO you'll ever see! Z5U capacitors can also be microphonic, hygroscopic (absorbing moisture from the air), and have nonlinear characteristics like "hook" and "soak" (dielectric absorption). Their advantage is that they're physically small, so have a high self-resonant frequency, making them very good for bypassing. There are, of course, dielectrics with intermediate characteristics like X7R, which can be used for filters of moderate bandwidth and other applications requiring good temperature coefficient, but not as good as an NPO.

If the kit designer used NPO capacitors only where NPOs are necessary, and you substitute others for them, what you build will definitely not work right.

Roy Lewallen, W7EL

My understanding is that it would be illegal if you were not a licensed amateur radio operator. Only they are allowed to hack radios that transmit (as long as they only transmit at legal frequencies and powers).

I could be wrong on this but I would guess that it is a 455khz center freq, 2.1 khz bandwidth filter. USUALLY the second set of numbers indicates the bandwidth in hundreds of hertz. The Y indicates the case style. Of course this applies only to most of collins filters. There are exceptions.

Just why would it be illegal ? As long as the mods ard done so they allow the cell phone to transmitt a legal signal in the ham band there is no problem. A ham can do anyting to transmitt a signal on the ham bands (atleast in the US) as long as the signal meets the FCC specs.

I purchased the ARD program ($150.00)several years ago and used it with great success for a while. One day, I found it would not load giving a small square box in the bottom left of the screen and locking the computer. There were others on this group that had the same problem. I have loaded a hard drive with windows and just ARD and it works fine.
Has anyone found the cause for it not working on many systems? Believe it or not, the league offered no help except to say they knew of the problem and no known fix was available. Great support!!

From: Dave Holford <holford@sympatico.ca>
Message-ID: <3977B795.48FD0629@sympatico.ca>
Source record: 59201

The 526-9337-00 is 2.1 kHz wide at 6 dB and 5.3 kHz at 60 dB.
It is a bandpass filter centered at 455 kHz in a type "Y" mounting which should be 2 3/16 inches long by 7/16 inch diameter with three solder tabs at one end and two at the other. So the F455 Y 21 coding provides frequency, mounting and bandwidth.

The other one is more difficult. The concentric flange, if it is around the middle, is likely a type "K". All I can tell you without any numbers is that it is probably a 455 kHz unit since I can't find any reference to a type "K" at any other frequency; but don't take that as proof that there are no other models around. It might be a special order custom one.

Hope that helps.
Dave

I think it means: 455 kHz center, 2.1 kHz bw @ -6dB, with -20dB at 456.8 and 452.7

>[...]I have no equiptment
>to
>find what these are.

You should at least ohm-out the coils, since they do open up. Each end has a coil which should show some small but non-zero resistance. In use, each coil is resonated with about 130pF.

The older and less-used a standard cell the more stable and reliable it becomes. The actual voltage it eventually settles down to is not of consequence because it can be recalibrated against the National Standard of the Volt. (Which for umpteen years I do believe has been based on the Josephson Junction, a poorly soldered dry joint held at some freezing temperature. And microwaves come in somewhere.) It can be reproduced with an uncertainty better than 1 part per million(?)

Mineral oil may fine for cooling dummy loads where loss coefficient of
the oil at HF is of no comsequence. But we should first of all check
that the oil would not convert the tuning capacitor into a dummy load.

The only stuff I'd put between the plates is PTFE sheets.

Al,

You have completely forgotten that the original US 800 MHz cellular system
called AMPS is plain FM with 30 kHz channel spacing. There must be millions
of old AMPS phones lying around unused when the 800 MHz systems are
migrating towards TDMA.

We have written new firmware for several Scandinavian NMT 450 MHz and 900
MHz cellular phones to help conversion to 70 cm and 23 cm. Most phones from
the 80's and early 90's still use conventional
8-bit processors like Hitachi HD6303, Motorola 68HC11, Zilog Z80 etc. and an
EPROM for storing the program. Any programmer with
some experience in embedded systems can write a simple ham firmware with

only the schematic diagram and some datasheets for reference.

See our site for more ideas and references

http://oh3tr.ele.tut.fi/english/modifications.html

And the answer for the original question from George is:

Yes, I already have a Nokia ME59 NMT900 converted for 33 cm waiting for my
next trip to USA :-)

Source record: 59207

Hi all,

I wonder if anyone out there knows anything about the Kenwood UT28S FM Modules (10 mtr).
I have a friend who worked out these modules use a 64bit "word" to control all the radio functions (tx/rx/up/down/mem etc etc).
He has played with the UT50 & UT1200 and successfully decoded the control word, to run them from a seperate cpu/pic.
However, he assures me both modules differ a little in their codes, and the UT28 would no doubt differ also.
Unfortuantely my friend has no time to continue his amateur hobbies, and declines to assist anyone with any type of 'electronic' equipment.

So, Has anyone got into driving any of these modules via it's serial port?

Thanks
Marty

This is a good starting point. Now reinstall other applications, one at a time, and after each one, test ARD again and you will probably be able to find the application that is "colliding" with ARD. Others have reported similar problems and have used this approach to isolate the problem.

These collision problems are quite common. A local computer guru may also be able to analyze the situation. The Registry is one place that snafus can occur.

> Has anyone found the cause for it not working on many systems? Believe it or

ARRL does not have the in-house expertise to deal with some of these difficult problems. Also, Compact Software is out of business these days. However, others have found that with some patient digging, the trouble can be isolated and fixed. ARD is a very nice program, so don't "throw in the towel". The effort is well worth while, in my opinion.

I use ARD very often and have had no trouble at all on three different computers.

Looking for a simple schematic for a BFO to use with older portable SW radios. Wanted for the 80 meter band, and prefer LC circuit over crystal control. If you have a source for one, it would be appreciated.

Each time you install a Windows application, some of the Windows systems files are overwritten with newer versions. Some versions have bugs which cause problems like you've reported, or a program is unable to work properly with the newer version for some other reason. You can usually find the problem file (usually a .dll or .ocx file) by backing up the entrire \Windows\System directory, updating each time you've installed another application and insured it isn't causing a problem. When the problem application is installed, compare files to find out which ones it replaced, and restore the old versions one at a time until the problem file is found. Chances are the problem application will still work ok with the older version in place. You might have to use DOS mode to do the file substitution, if the file is in use by Windows. You might also encounter a situation where the file substitution disables Windows, requiring you to boot into safe mode or reinstall Windows, so don't do this unless you can deal with a potentially serious crash of the operating system.

Hello--

And, Z5U capacitors can be "talkative"-- one company I worked at used them for triac snubber capacitors (an extremely unfortunate choice due to thermal instability), and the damned capacitors would produce a 120-Hz buzzing sound. The high peak-current transients would apparently flex the ceramic, just like a piezo buzzer element.

Sorry folks, been on holiday!

The National Standard Volt (at NPL), like that at the NIST (USA) and others, was long based on banks of Weston Standard Cells maintained in oil baths at 20 deg C. I believe that this is still the working standard but the primary standard is now the Josephson Junction which relates the volt directly to frequency. I am not back at work yet so cannot look up the numbers [1] but the the uncertainty is somewhat better than one ppm!

Modern Standards Labs DMMs (Hewlett Packard 3458A, Wavetek/Datron 1281 to name but two) are capable of stabilities of around 1ppm/yr and overall uncertainties of ~2-3ppm dependant on environment and calibration source uncertainty [1].

A simple replacement for the Weston Standard Cell is a home manufactured Daniel Cell (q.v.) which (IIRC) is 1.008V provided the cell does not become polarised. This may be manufactured by an enterprising "ham" - we did in A level physics some(!) years back.

The Bradley CT471 - I haven't seen one of these for years - thank God.

[1] I *should* know the numbers but....

Ken,

I'll look through my files, I know I have a simple BFO 'cause I built it about 10 years ago.
It is a one transistor oscillator using a black core shielded can from a pocket AM radio. I'll hunt it down this weekend. Can you recieve and look at .jpg files with your computer? If so, I'll try and scan the diagram and send it as e-mail. Drop me a note if you need a black core shielded can - I have several of them.

good luck,

I don't think we've got much choice. More and more components are being made in SMT and fewer and fewer with leads.

Besides the size advantage, the lack of lead inductance is highly beneficial at high frequencies. Some SMT designs simply wouldn't be possible with leaded components.

We all know the down side, but we're going to have to learn to live with them.

In small disc ceramic caps, the permitivity of the ceramic dielectric
(and its thickness) is changed to enable you to have a range of capacity
values without changing the physical size of the cap. The permitivity
changes with temperature. The temperature coefficient of the permitivity
of the lowest values (say, 1pF) is typically +100 parts per million
(P100). When you get to ~10pF, you get to 0ppm (NP0), and start to go
negative at ~22pF. Relatively large values (1500pF) have large negative
coefficients, and the capacity changes greatly with temperature. Care
should be taken when using such caps in tuned circuits (especially
oscillators). They are generally only suitable for coupling and
decoupling.

1045. Anyone modifiy a cheap CB linear for 6m band?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-21 00:00:00 UTC
From: "Leland C. Scott" <no-spam@junk-mail.net>
Message-ID: <8lal20$mcu@nnrp2.farm.idt.net>
Source record: 59220

I have a couple of non functioning wide band AM and SSB, 3MHz to 30MHz, linear amplifiers sitting in my junk box for years, that were used on the CB band at one time. Not by me by the way! I think the only thing wrong with the one amp is the antenna change over relay is shot.

I would like to know if anyone has tried to use one of these amps on the 6m band. The one I am thinking about fixing uses two MRF455's in a push-pull configuration, about 125 watts PEP max rated, working into a wideband coaxial output transformer. The input also uses a wideband coaxial transformer too. My Motorola RF Data Book has the data sheets for this transistor, but there is no data for anything above 30MHz. I suspect the gain will be down by at least 3db, but I don't know if the input match will be screwed up, and if there will be problems with the matching transformers. I figure if it works I should be able to get around 50 to 60 watts PEP out of it. I would like to give this amp to a friend, who is building a Ten-Tec 2m to 6m transverter kit, since he does not have an amplifier for this band.

Me? I like it. I prefer it. If I lay out and etch a board,
it's SMD. I've never had much use for all those hold-down
widgets - slender fingers, long fingernails and myopia work
much better. For me, anyway. :-)

Sometimes you don't have a choice: Many components nowadays
are made SMD first, through-hole later, if at all.

The final decision is yours. Whatever turns your crank...

Horowitz and Hill in "The Art of Electronics" state that it is
possible to measure voltages reproducibly to 1 part in 10^7 using
a Josephson junction. Hams won't be using these things much
until someone develops room-temperature superconductivity, however.

I don't think you'll find that there is any appreciable dissipation
with either kind of oil, but anything you put in there will increase
the capacitance. I think Teflon will take it up by about a factor of 2
and oil will be around a factor of 3.

Adding a sheet of anything, so that the dielectric is now varied
across the gap, will lead to concentration of the E-field in the part
with the lower dielectric constant. This will actually make the cap
LESS reliable.

1053. Problems aligning the VFO of an HW-9

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-22 00:00:00 UTC
From: Trevor Jacobs <fxtech@earthlink.net>
Message-ID: <NTpe5.86$ga2.4416@newsread2.prod.itd.earthlink.net>
Source record: 59098

Hi Everyone,
Maybe one or more of you have run into this problem or can direct me to an elmer. I can't get the VFO range to align up with the dial on this HW-9. The trimmer capacitor on the Air Variable doesn't have enough range along with the VFO coil to line things up. It's off by like 20 KHz. I built this HW-9 around 1987 and it went to the factory for alignment in 1989 (I wasn't fourtunate enough to have a Frequency Counter at that time). However, I'm now skeptical that this rig has ever been aligned correctly. Man talk about touchy alignment to! If you breath on this thing it shifts by 20 or so KHz. I've scoured the web and found a few things, but I'm worried that any tack on fix may just be masking another problem. Any Ideas (other than dump this rig and get an Elecraft K2.) ? Thanks and 73's

Trev

I do not have a copy of the circuit, but suspect the VFO variable is in
parallel with a fixed capacitor. Simply replace the fixed cap.
You may have to replace it with a higher or lower value than original
depending on the direction the freq is off.

1055. 70cm TX converter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-22 00:00:00 UTC
From: Duffer <hduff@ica.net>
Message-ID: <397A3766.DC28AB7C@ica.net>
Source record: 59100
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap

Anyone interested in a Hamtronics XV4-2/5 linear 70 cm all-mode
transmit converter ? Converts 10 mW of 28 - 30 MHz to 432 - 434 MHz
or 435 - 437 MHz (comes with both IF xtals) at about 1.5 to 2 watts pep.

Good for OSCAR or terrestrial use.

See Hamtonics web page for more details:
http://www.hamtronics.com/hamtronics.html

Looking to get about $45 for this board and the optional second crystal.

E-mail me if interested.

1056. FS: High Voltage Bulkhead conns and Patch Cables

For Sale: 6 each BNC style High Voltage Bulkhead feedthrouh connectors. Removed from equipment. Mfg by Gremar. these are good for greater than 5 kv and have the Gremar part number 16532 stamped. With 6 short patch cords with recoverable High Voltage BNC style connectors that mate with the Bulkhead feedthroughs. types 00795-171015N000 and 00795-1701029N002. A possible solution for the hard to find Millen HV connector. 6 bulkheads and 6 patch cables. $15.50 post paid conus.

tnx for the read

Are you sure it is not the earphones ? If it is an inpedance thing, you could try paralleling them with about 15 or so ohms of resistance.

Hi Craig,
Give me a shout at my e-mail address, and I can help you.
I've got their databook. For anyone elses infor, the CFU series are 4 element ladder filters, the CFW and CFWS series are 6 element ladder filters, and the CFS series are 15 element filters. The E and F bandwidths are for NBFM, while the G is 8KHz, the H is 6KHz, the I is 4KHz, and the K series is 2.4KHz (I am talking about total bandwidth, not +/- bandwidth. An example part number would be CFU-455K. Hey Craig, I can't remember it I sent you a filter or not, when I sent you that receiver board. Let me know, if you need another one!

I think it pays to have some experience with SMT. I, for one, got
tired of using the LM386 and wanted to take advantage of the newer,
more efficient audio amplifiers. Most of the new ones do not
come in through-hole packages. SMT using "SurfBoards" was a
nice solution. You will find that more and more chips will be
available only in SMT packages.

Well suppose he wants to use a transverter. To cover the frequency range may require operation outside of the normal ham bands. For example a transverter from a 28MHz IF frequency, 10 meter band, to the 2 meter band. The 2 meter band is 4 MHz wide so you can't cover the complete band using the normal 10 meter band limits. It is legal to go outside of the band, on the rig being used for the IF frequency, so long as NONE of the IF energy gets radiated. Its done all the time.

1063. Help with Ameritron AL 84

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-22 00:00:00 UTC
From: Mike <michaelj@networktel.net>
Message-ID: <KGbe5.542$qm1.10269@news1.atlantic.net>
Source record: 59231
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I recently rebuilt an Ameritron 84 and have had great results with 20 meters getting the full 400 Watts out with 100 watts in SSB. Great reports on 15, 20, and 40. Rig has been very stable and clean for a tube rig.

I contacted Ameritron on the mods for 10 meters, They faxed me the mods but their example amp is a bit different than mine. They show a tap off the tank coil two turns from the 15 meter tap. Their diagram shows a 5 coil tank coil. Mine has seven turns, Their other mod to complete it has a jumper between the input resistor and a 68pf cap. Mine rig has 3 caps in this location and none of them are marked. I have tried several different jumper locations with no luck.

Their Mod instructions are for serial # 100 and higher. My serial # is in the 70 range.

I talked to an Ameritron tech and he had no idea as these AL 84's were made in Ohio before their move to Miss.

Any one with any ideas is appreciated! I use 10 meter in my car and the band is really starting to open up. I'd like the extra punch on the base unit Yaesu FT840 which gives me about 80+ into a beam.

Thanks Mike

According to W5RAS who is one of our local repair gurus, the no tune hf amps will sometimes work on six. He has fixed several over the years and found that some would work just fine on six. About 2 years back the 20m to 6m transverters were popular around here and people were scrounging around for amps to use with them, so some were tried. Now most of the people here who are on six are using icom 706xx models (I have the mkIIg) and have no need for amps since 100 watts is overkill. Before you give the amp to your friend, be sure to get it to a spectrum analyzer to see just how pure a signal it puts out on six, it might make the radios of the 50's and 60's that caused tvi look good.
thanks, John.

You realize you have severely compromised the antenna, right?
It's not quite a dummy load, but it's not far from one either.
Improving it is making it long again!

2 rules:

Make it LONG,
Make it HIGH.

Like others have said, SMT is here to stay. Small size, less lead inductance, componets on both sides of the PCB all add up to smaller, higher frequency, more dense boards. Some SMT components are in high demand today with some on allocation of 52 weeks or more. If you like building, you had better get two solder irons and a scrap SMT board and start practicing removing and installing parts. One other advantage of small simple SMT circuit is fewer holes to drill so PWB cost should be less.

Has anyone any of the old I.F.Transformers
which used to be used in valve radio circuits?
I am looking for a pair (at least) of 465KHz
or 1.6 MHz ones.
The type I am after are housed in aluminium cans
approx 7/8 inch (22mm) square by approx
2 inches (50mm) high.
Chassis fixing is by two 6BA screws.
If anyone can help, I would be most grateful.
Willing to pay for some in good condition.
Please reply soon.
Best wishes,
Duncan G4DFV

I started designing boards in SMT on the job in about 1986; at the
time I think we were one of the first small companies to switch
over. (Early on, it was easier if you were big and owned your own
lines.) Now, it's just a question of who will be the last to
switch over.

I never regretted it, I quickly decided I liked the SMT stuff
way better. Hand construction is maybe a bit harder, but rework
is vastly easier, so alltogether handwork is easier in the end.

Things you will need:

* a new soldering iron (mmm, metcal :-)
* a magnifier you can work under
we used an inspection stereomicoscope, at home
I think one of those ring florescents on the
spring arms with the big magnifier in the middle
should be good. You only need about 2x - 5x.
* a hot tweezer thing is helpful; otherwise it's really
hard to unsolder chip components without using a
heat gun (and heat guns tend to overcook stuff)

Unfortunately, while SMT really rocks, it poses problems at home.

I must admit that I don't know how I'm supposed to breadboard
and experiment with the stuff at home, though. Anyone have any
ideas?

Perhaps the folks who do produce the solderless breadboard line need to add an smt compatible version, instead of the valley between the two sides it could have miniature clips that would hold each end of a two terminal device and connected to the connection spots on either side. Or perhaps someone could come out with a line of small pcboards that you mount your smt parts on and then connect the boards together with jumpers.

Admittedly both those solutions would be useless at the type of frequencies that smt parts are best for. For someone just getting into smt, working on a project that is a direct conversion of larger leaded parts, it could work.
thanks, John.

John,

Thanks for the info. I suspected the amp may work on 6m, and you confirmed that. I don't have access to a spectrum analyzer however. I know this amp does not have any form of filtering on the output. I was wondering if a 6m low pass, or band pass, filter would be good enough without checking the output with the analyzer. I was going to advise my friend to use one, filter, in any case if he wanted to try the amplifier.

Oh, one more thing, I use a IC-706MKIIG too, mobile, and a FT-847 in my apartment. The IC-706 is a great rig.

Thanks,

Leland C. Scott

1077. National HRO-500

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-22 00:00:00 UTC
From: Jim Bo <jbollit@ix.netcom.com>
Message-ID: <397A0F03.7C8A938E@ix.netcom.com>
Source record: 59245

Hello,

I have a National HRO-500 receiver that has a defective BFO coil.

The reference designator is L-24. It is a 1 milli-henry
adjustable coil with a low impedance tap.

On a long shot, does any one have one that they can part with?

The manufacturer's part number is 273F6523. Does anyone
recognize this part number scheme that could identify the
original manufacturer of this coil?

The size of the "I.F." metal can that houses the coil is 3/4" x
3/4" x 2.0" and has a 1/4" slug to adjust the inductance.

Does anyone have the winding info (number of turns) on this coil,

especially where the low impedance tap should be on the winding?
Worst case I could wind my own if I had the # of turns for the
low impedance tap.

Any and all help greatly appreciated, I want to get this radio
back into service.

Jim

Yea, I thought of that also. The only cap that it is directly parallel with is the trimmer on the 7 to 17pf air variable. It's not just a matter of shifting the frequency range either. The bandwidth and alignment of the VFO are both adjusted in this circuit. Any idea what the value of the trimmer cap on this air variable may be? It seems like it needs to be of a lower value. Thanks and 73's

No...It's worth fixing. Can not tell from your description exactly what the alignment problem is. You must determine whether you need more or less capacitance, more or less inductance (either of which will fix the problem). That type of VFO will NEVER be linear across the band and small calibration errors will be almost impossible to eliminate, but you should be able to get it close enough so that you are comfortable with it.

I use walkman type headphones on my HF rigs (lazy, light).
Get lots of distortion. I thought that they would be very low
impedance, but it turns out that in parallel they are 26 ohms.
Clearly, a poor match for anything. Rampant distortion.

Any easy way to convert, say, 8 ohms to 26? Perhaps filament
transformers. Tried using an LM386, and it doesn't like them either.

Perhaps an old 70.7 volt PA transformer. This one has me scratching
my head

Jim, you're right. Inserting ANYTHING between the plates will cause the residual air gap to ionise at a capacitor voltage less than before insertion.

There are three solutions - reduce transmitter power output, install a capacitor with greater plate spacing, or use a vaccuum capacitor as someone has already suggested.

Hi Jerry,
This is going to sound stupid, but have you tried another pair of Walkman-style phones? I think yours are defective. I use the higher-impedance Walkman-style phones for every one of my receivers and transceivers, with no problems. In fact I think the audio sounds better with them than with 8 ohm phones. Do not use the $1.99 "el cheapo" Walkman phones. Spend $20 or more and get a decent set. Get the kind that cover your ears, not the small, lightweight type sold for belt-clip portable cassettes and radios.

1087. alkaline AA battery question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-23 00:00:00 UTC
From: hexter@blazenet.net
Message-ID: <snktqceajjt122@corp.supernews.com>
Source record: 59112

If I were to charge a AA alkaline 'normal type' cell with 10 ma of current, what would be the outcome? Don't say right off the bat "they will explode" or "they will leak", because they haven't.

They are Varta brand, and I have been using them over and over again in a CD walkman player. I did wipe out some C cells once, but they were being charged at a ni-cad rate (because i forgot to set the charge switch to 'NO') and spewed coffee looking goo all through the insides of my Ballentine portable 3/24A meter.

So my question is this, at the very low charge rate, am I actually recharging the battery? Am I simply de-polarizing it? Am I reversing the chemical reaction and truely storing energy that can be had days later, without loss due to leakage resistance that I am creating internally?

What do you think?

1088. FS: (4) Old Radio/Electron Tube books, 1937-1950

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-23 00:00:00 UTC
From: oldbooks78@aol.com
Message-ID: <20000723012222.21426.00000347@ng-fo1.aol.com>
Source record: 59113

I currently have for sale the following old radio/electron tube books. Prices include book rate postage (within the US). The books are:

"Fields and Waves in Modern Radio" by Simon Ramo and John Whinnery, published in 1944 by John Wiley and Sons. The 502 page hardbound book is in about very good condition. Some scattered notes in the text, but otherwise nice. Available for $10.

"Communication Engineering" by William Littell Everitt, published in 1937 by McGraw-Hill. The 727 page hardbound book is in about very good condition. There is a previous owners name inside the front cover, and a few scattered notes in the text, otherwise nice. Dark green cloth covers with gold lettering on the spine. Available for $10.

"Elements of Radio" by Abraham Marcus and William Marcus, second edition, published in 1950. The 751 page hardbound book is in very good condition, clean with no page tears or pen marks other than a previous owners bookplate inside the front cover. Available for $10.

"RCA Receiving Tube Manual" for 1940. The 255 page softbound book is in about good condition, with the rear cover missing. The text is otherwise whole and complete. The contents include radio tube characteristics, tube installation, technical data for each tube type, radio tube materials chart, and much more. Available for $6.

If interested in any of the above, please email to "Oldbooks78@aol.com" to reserve. Thanks, and best regards.

From: paul <paul@nospambtinternet.com>
Message-ID: <O7HDqaBl+re5Ewea@btinternet.com>
Source record: 59115

Parmeko HT transformer for sale.

110 or 240 volts input, centre tap bi phase output at 2.5, 3, or 3.5KV per leg @ 248Ma.

Possible DC output voltages 3.5KV, 4.3KV or 5KV at 248 Milliamperes after capacitor smoothing.

The transformer weighs 80 lbs, is oil filled, with ceramic insulators, an interwinding screen and the biggest Parmeko make. Current price new is ï¿½2000 plus (Obviously I'm not looking for this price for it).

It comes fitted into am aluminium sub chassis complete with 110 volt control relays and Ferranti HS32 high voltage rectifier diodes.

Owing to the weight, as it is a 2 man lift, any buyer will have to collect from South Wales (UK).

Paul

> What do you think?

You may indeed be charging the battery, but at what efficiency? If it takes 100 amp hours of charging to put 1 amp hour of use back in the battery then it would cost you less to buy new batteries. Nicads and NimH batteries are popular because they are easily recharged, a high percentage of energy in is available as energy out. I tried the rechargable alkalines available from rayovac a couple of years ago, the first time I recharged them they spewed white fuzz all over the charger. Now for high current use I use NimH, I still haven't found a battery type that is rechargeable and has a long shelf life. Short shelf lives work ok in an ht, where I will use it and then recharge every day or so, it doesn't work well in items like calculators or tv remotes.
thanks, John.

Hi Gang,

To increase the voltage breakdown without
physically disassembling the cap, you
can also try applying a doping material
such as corona dope or other type of
brush-on or spray.
You can find them at the popular
electronics supply houses or even
RadioShack.com (not the retail store).
Good luck,
Bennett ko2ok

Source record: 59124

Update
After having taken the plate tune cap out a few times and trying clear shipping tape (RF punched right through shipping tape, And plates were getting real hard to aline)
Decided to look for a higher rated cap, Found one just over 5 inches long for a reasonable price at Antique Electronic Supply.
The Dentron 160-10 L has a shield that zig zags down the middle of the amp and doesn't leave much room for the plate tune cap, Flipping it around the opposite way left plenty of room for the new cap.
Had to stand the filament choke straight up and re drill and tap some new holes in the shield, relocate the HV rectifier stack and the ant relay (What a job!)
The size of the cap nearly doubled, 10 and 15 meters would not load properly with all that stray capacitance.
After reading some of the Orr. W6SAI handbook, I decided to try to raise the Q of the tank circuit by shortening the taps on the coil till i could get it to load on 10 and 15, I still feel I need to move the 10 meter tap a little more but have already moved it a lot already, At least it seems useable.
One thing that does bother me with this amp is with 160 meters, The loading cap seems to have almost no effect, And max pwr seems to be with it open all the way, There are no extra fixed caps that get switched in with the loading cap, Just don't seem right.
That's were things are right now.
Tnx for all the suggestions I got.
Steve

I think there is a good chance that this won't even work in theory,
and I certainly don't think it is practical to expect to be able to
get corona dope into this gap without just making things worse. In a
tight space like this the coating would have to be perfectly smooth.

Hello.
You are indeed recharging the alkaline battery. If you use a low charging rate, as you are, you can successfully recharge alkalines many times. You don't get the full charge capacity, I forget what it is, perhaps 75% or less, but you can recharge them if you use low current. I've known some people who recharge them hundreds of times. Each recharge you get a little less capacity, but it can be done.
The commercial rechargeable alkalines use the exact same battery makeup as the regular type, only they give a little empty space in the cell to allow for more rapid recharge.
I've read articles describing all this, but I can't tell you offhand where to find them.

Check CCI to see which transistor they use.

www.comunications-concepts.com

You are getting a lot more information than I got when I was repairing a 10/6 meter linear, mine was tube. I am homebrewing a 6 meter linear, 4W out is just not enough. The only recommendation I got was to use a tube final (6146). No one recommended any solid state set-up which I thought was odd.

Currently disassembling a couple of microwave oven transformers to rewind them to 600V, 250V, 50V, and 6.3V. WHAT A PAIN!! Did you know they weld these together.

Let me know how your project works out, I might consider trying something similar, however most CB amp I have seen go for a small fortune.

1113. FT-33 offset problem...help ???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-24 00:00:00 UTC
From: Duffer <hduff@ica.net>
Message-ID: <397CDAC7.1301E277@ica.net>
Source record: 59138

Hi there.
I have a Yaesu FT-33R 220 MHz HT that has a problem.
I aquired it in this condition and believe that someone was doing a
little fingerpokin inside the unit.
The problem is that the unit will not offset the transmit frequency when
the RPT
button is pressed. The micro does respond to the keypress and the - or
+ icon
appears on the screen but the unit simply doesn't TX on the proper
offset (+ or - 1.6 MHz). It transmits on the same frequency that the
receiver is set to (simplex).
There are signs of tampering around what appears to be the configuration
diodes
that often sets the micro for whatever radio chassis the microcontroller
board gets installed into. I'm wondering how it should be by default for
the FT-33R.
Perhaps the offset problem is related to this.
If not, I'd like to hear from anyone with suggestions to remedy the
problem.

Also, if anyone has a schematic for the micro section of an FT-33 or
FT-23,
I'd be grateful to hear from you.

Thanks de Hugh VA3TO

1114. saturating inductors

I've hit the reference books and come up empty. What happens when you partially saturate the core of an inductor? My instinct is telling me I could run a small amount of DC through an extra winding on the core of a transformer, and control the amount of signal transfer from primary to secondary. But knowing little about core materials and inductors in general, I'm wondering if I'm going to be changing more than just the amount of transfer (if indeed I'm changing that).

Source record: 59141

You don't necessarily change the amount of signal transfer. When you get near saturation you lose incremental inductance. The signal will probably become distorted because the source will be loaded nonlinearly. The coupling between primary and secondary will be affected but the relationship is not a simple one.

I use a CB transceiver modified for 10M as a motor bike comms set.
I now need to add an intercom facility.
It seems that I need to activate the Mic, without activating the transmitter, then disable the receiver while the mic output is fed to the audio amp.
Anyone familiar with the switching arrangement that I could use, I believe one step is to break into the centre tap of the volume control pot.
TIA.
Regards,
Chris Furse

I have this company bookmarked. Never thought above checking out the design they have. You have a good idea because they do publish the parts list, so I can see what power transistors they use.

> You are getting a lot more information than I got when I was repairing a
> 10/6 meter linear, mine was tube.

I knew a tube amp would not work without modifications due to the input and output matching networks.

> I am homebrewing a 6 meter linear, 4W
> out is just not enough.

I think the Ten-Tec transverter my firend is building will output only 8 watts PEP. A little low for busting pile ups, even with a good beam antenna, which he currently does not have.

> The only recommendation I got was to use a tube
> final (6146). No one recommended any solid state set-up which I thought

So do I.

> Currently disassembling a couple of microwave oven transformers to
> rewind them to 600V, 250V, 50V, and 6.3V. WHAT A PAIN!! Did you know
> they weld these together.

Nope. But I seem to recall having read where the core is gapped to keep it from saturating from DC current. Seems like the manufactures use a really cheap halfwave rectifier circuit in those ovens.

> Let me know how your project works out, I might consider trying
> something similar, however most CB amp I have seen go for a small
> fortune.

You can normally fine them used, and cheap at a local Hamfest. These are typicaly being sold by ex-CBer's who got fed up with the crap on 11 meters, and finally got their Ham ticket. Now they don't need the 11 meter junk any more.

It also seems like there is usually some Bozo CB radio shop owner at the medium to large swaps selling only the known CB radio models that can be

easily modified to operate illegally outside of the 11 meter band. Then, the next table over, is another Bozo selling 100 to 200 watt "10 meter" amplifiers. Does not take an IQ over 50 to figure out what is going on.

I'm surprised the local Detriot FCC field office does not go to some of these swaps, and bust some of these people. The Detriot FCC field guys jumped all over some guy at the Dayton Hamvention, last year (1999), for selling non-type accepted HF amplifier kits. He was located in the tent area way out at the edge of the flea maket outside.

Anyway I am going to screw around with the amplifier I got. First I have to get it working in to a dummy load. Then I'll see if it with work on 6 meters.

Hello--
Look for books or articles that describe "magnetic amplifiers"--
these devices work in a similar fashion.
Also, older textbooks covering magnetic components may have a
chapter or two on the topic.

Actually, the 6JE6/6LQ6 will work on 6 meters. I have a Knightkit T-175 10/6 meter linear (that some idiot completely screw up). This the final that they use and is not too unpopular as finals in both Ham equipment and CB linears.

I have a Kenwood TS-660, like most of the TS-6x0 family, it is rated for 10W, mine seems to run about 8W in, 4W out. Pile ups are tough, I have to either use CW of add QRP to my call it get attention. I don't want 150W, 20-50W out would be fine and the only 6 meter amps are 150W and $350.00.

I am going to try to get the KnightKit going so I don't upset any BA fans although I considered using it for the amp. I could buy a HP-23 Heathkit power supply, but I haven't would a transformer since I was a teenager so I thought I would REALLY start from scratch, also I save some money. Peter H. Dahl sells a replacement transformer, but he want $150.00, too much.

Well document what you do, and write up an article, I sure some magazine will pay you, QST, 73, World Radio, CQ, for this because this would be something many Hams might be interested in.

1124. Re: FT-33 offset problem...help ???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-25 00:00:00 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <397DF57B.F0FC4245@dialpoint.net>
Source record: 59053

YOu might try looking on some of th modification web sites. They probably have a mod that will tell you what may have been done. I know there are some pads that can be soldered across and it will change the band limits and maybe the readout to chanel numbers instead of frequency for the memory chanels.

Interesting Chris..I don't know what kind of CB you are talking about yet, but it is possible that the modulation transformer also has the winding for the speaker too. If that's the case then you just need to figure out how to disconnect the modulated B+ line to the RF output stage during transmit mode and reconnect the speaker. To control the volume of this arangement an amplified mike with a volume control on it would come in handy.

Do you or anyone else in the NG know of how to convert a Cobra Model 19DX CB to cover a range that would include the 29.0 - 29.1 megacycle AM window on ten meters? Mainly I need to know how to modify the PLL circuit..I can take it from there and do the coils.

1128. Re: To SMT or not to SMT?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-25 00:00:00 UTC
From: Dr Mike Addlesee <maddlesee@uk.research.att.com>
Message-ID: <397d63fb_2@nnrp1.news.uk.psi.net>
Source record: 59057

I find SMT very convenient as you don't have to drill holes in FR4 board and run the risk of breathing in fibre glass dust. I also found it a great help to tin plate the PCBs first, makes soldering much easier.

Date: 2000-07-25 00:00:00 UTC
From: robbyjaf@aol.com
Message-ID: <20000724214436.29723.00001249@ng-da1.aol.com>
Source record: 59142

From:robbyjaf@aol.com

Goodluck looking. Most have gone out of business back in the sixty's or seventy's.
They could not keep up with theoriental influx of radios and parts. And everybody quit building back yhen so even the part manufacturers died.
But HARK--you are still in luck almost somewhat. Hammarlund, National, Millen and a few other "Parts makers"and what is left of their inventorys and some new stuff is available at the CARDWELL CAPACITOR site. They are still in biz and have a web site. It can be found on the AOL server by typing the above and then looking in the list of sites they provide. I am sorry I do not remember their home page.

B&W still makes antennas in FL and has a few old coils and chokes and their PA cioil sets
MILLER is still around in south Los Angeles but not too much old stuff.
Most of the mail order places are still in biz but do not "cater" to hams anymore--just computer crap and general stuff you can get at Radio Shack.

Sorry to burst any bubblesand i was sorry to see them go--but there are new places on the net that carry what they use to carry
TRY THESE:
Ocean State Electronics
Antique Radio Supply
Surplus Sales of Nebraska
Dan's Small Parts

to mention just a few!!

Also try "Electronic Parts" as a search word and I know there are a bunch more.

Hope this helps and good luck.

steve your chasing your tail. I have been there and done that. what you are doing now by playing with the output coil is messing up the impedances. those tube want the proper z to get max power out. moving all of the components around has screwed up almost everything. When a manufacturer builds a linear they always "brass board" a design, every component affects every other component. I have been playing with this type of problem in my own home brew 4-1000 for a long time. Based on experience, I would recommend the following:
1. look for a vacuum variable. the minimum c is less then the original cap you had in there, thus you will be able to tune 10 & 15
2. to get a single pi network to tune 160 - 10 mtrs is almost impossible. if you look at comercial designs they switch in other coils for 160, I don't know what they are doing in your dentron. the proper vacuum variable can give you more overall c while still having less c then the original you had.
3. I dont know how much plate voltage you are running but you can find the 3 kv type of vacuum variables quite cheap. I bought one for $25 via this web page. I am sure i will not be using it now (gave up on 160 - 10 now only woring about 80 - 10)
4. may i also suggest that your rig is possibly generating excessive vhf parasitic's. look at rich measures home page about how to correct this problem (nichrome wire it works!!!!!!)

good luck

I may have kicking around something similar to what you want. In the U.S. the IF freq was always 455 khz. you proably could could play with the resonating caps inside the can to shift it. I assume that you want the double tuned type. I am almost positive that I do have one maybe two of the 1600khz types. These cans fit you description pretty close, however the mounting could be via clips that go around the can and thru the chassis. Let me know if you have interest. E mail me and we will work out the details.

People have described oscillators that were varied by voltage into an extra winding. I'm sure I've seen this sort of thing being done commercially, maybe using special cores, but I can think of once or twice there being an article in a ham magazine about this.

This is vague, but one article that comes to mind was in QST, 1977 or 1981 comes to mind, (in the same issue that Wes Hayward had an article about a simple 2M transmitter that used a VCO at 144MHz and a divider chain to lock it to an 89MHz crystal). I think the author was from somewhere in the UK.

My 1978 edition of Amateur Radio Techniques from the RSGB has a small section on the topic, referencing some articles in Wireless World.

I can't recall seeing this sort of thing used in anything but voltage controlled oscillators.

Source record: 59062

I breadboard SMT by using an exacto knife to cut patterns in blank double sided PCB. As long as you stay with the "larger" SMT like 1206 resistors and SOIC (50mil lead spacing) it works well.

I have breadboarded some of the Analog Devices DDS chips (32 mil ! lead spacing) with mixed success. (At any rate it makes the 50 mil spacing look ***BIG***)

I leave lots of blank space between circuits and interconnect them with 30 gauge wire. This both gives me a good ground plane and plenty of room to add the circuit that I really need at a later date.

For a breadboard dont try to make it super small. You want room to play with it and modify it. When you get what you want then you can go to a PCB and make it small.

What really begins to bother me is that he is doing the same thing with his full coverage announcements on the dx packet cluster. If he doesn't stop that crap, someone is going to do something nasty. If anyone wants to see his web page they would already have done it by now, and if there is anything worthwhile to see, it will all take care of itself via the search engines. Guy must have some serious ego problem to want to advertise it so much; either that or he is making money on each hit.

There might also be a reference on the amidon web page.

Core saturation is a worry with switch mode power supplies.

Hello--
The commercial product was called an "Increductor". These were used
in sweep generators and other test instruments in the 1960s-1960s.

Guy I used to work with at Eddystone had an RSGB technical topics item published early 70's which used a toroid in an attenuator with DC in a second winding controlling the attenuation. I remember being extremely skeptical at the time about the frequency characteristics but it was surprisingly (to me) flat when we tested it.

A US company Vari-L used to (maybe still) make DC controlled inductors for VCO's.

STRICT LAWS URGED FOR NET STALKING

SACRAMENTO -- Federal and state laws should be strengthened to help curb the growing problem of online stalking, a U.S. Justice Department report recommends. Internet service providers, which link users to e-mail and the World Wide Web, report a growing number of complaints about harassing and threatening behavior online, the report said.

Honolulu Advertiser, 9/16/99

The Illinois State Attorney of Cook County, has proposed legislation prohibiting harrassment or threats on the Internet. From the reported proposed penalty, threatening or harrassing via the Internet would be a Class 4 felony in Illinois, punishable by up to 3 years in prison. The state legislature has not yet considered this proposal.

Hi Cliff...

One thing to be careful of is how the "DC" winding is configured. If it's just another transformer winding on the core, then if you drive it from a low impedance, that same low impedance will short out that winding for AC...and probably put too much load on the transformer. In something like a torriod core, you can put a winding outside the core, over the whole transformer, and affect the core flux with it. With an "E-I" core transformer, you can have the transformer wound on the center leg and have a balanced pair of windings on the outer legs, connected in series to get no transformer action with the center windings but which can put a flux around the outer magnetic loop (potentially causing it to saturate). You can also put an inductor in series with the DC control supply so it doesn't load the AC part of the signal, or use a high-impedance current source instead of a low-impedance voltage source.

Also, as someone else posted, the effect on actual transformer action may not be quite what you expect! Consider, instead, ways you might have two possible magnetic paths through the primary. One of them also goes through the secondary, but the other one goes through a "shunt" whose saturation you can control with some other winding. Then you may be able to actually control the coupling between primary and secondary. In fact, if you put a primary winding on the center post of an E-I core and a pair of (identical) secondary windings, one on each outer post, and put identical loads on the two secondaries, you should get essentially identical outputs. But if you simply short one of the outputs, that will force most of the field through the other secondary, increasing its output.

Source record: 59076

I've got a really neat gizmo in my junk box, from a Sony TV set. It's a great tool for simulating conversations with engineering job candidates. It's a ferrite bar with a dozen or so turns wound on it. Glued to one end is a disk-shaped ferrite magnet. At the other end is a cylindrical piece of ferrite with a hexagonal hole in it, oriented and confined so it can be turned with an alignment tool. The axis of the cylinder is at right angles to the rod's axis.

The ferrite cylinder is a magnet, with poles on opposite sides (that is, a line from N-S, is at a right angle to its axis). So as you turn the cylinder, the poles alternately face the end of the ferrite rod. This results in either cancellation or reinforcement in the rod of the field from the permanent magnet at the other end. When reinforcing, the ferrite in the rod is pretty heavily saturated. The result is an inductance that varies over a surprisingly wide range as the ferrite cylinder is rotated. (As I recall, it was 20:1 or so.) To avoid distortion, the field created by the signal applied to the inductor would have to be small compared to the field from the magnets.

I'm told that this inductor was actually used to distort a signal, as part of the convergence or geometry correction, so it actually had a large signal applied. It would work well as a variable inductor for a small signal, though. (I wouldn't put any money on its temperature stability, however.)

Another use of a saturating inductor, incidentally, is the "swinging choke". In a choke-input filter, the required amount of inductance is less when the current is greater. So a saturating choke can be used to save size and expense. I tried one some years back in a switching regulator design. It worked well, but the field escaping from the pot core increased dramatically as it saturated, so I abandoned that approach.

I must have that circuit in front of me right now. There is something
along those lines in my 1978 edition of Amateur Radio Techniques, which
was compiled by Pat Hawker who did Technical Topics, and I thought the
material in the book came from the column. I had forgotten about that
attenuator until you mentioned it.

The bit goes into detail about how the writer worked on the idea,
and his results.

I'm still not sure whether Cliff was looking for a new idea, or
was trying to understand saturation. The way I read his question,
he seemed to see the potential.

I need a PTC resistor to temperature compensate a log amp (per the Analog Devices AD536 and AD637 True RNS detector circuits.) While AD specifies a part number, none of the usual suspects (Allied, Arrow, Digikey, Mouser) carries a PTC resistor with a 3400 ppm gradient although there are PTC's for other applications.

Perhaps there is another way to do this with an LM34 temperature sensor.
Anyone out there have any bright thoughts?

PS - the need arises from blowing up the power supply for my photomultiplier tube - it's cheaper to just rejigger the innards.

This goes back to the seventies when I worked for a keyboard manufacturer. Their "keyswitch" was a small toroidal transformer. Primaries were arranged in "row" lines and secondaries on "column" lines; pulse the primaries and watch the secondaries. When a key was *not* pressed, magnets were next to the toroid and saturated the core; no output pulse. Push a key, move the magnets, get pulses. Elegant.

Never thought much about it until now, and I don't have an intuitive enough feel for inductance to "visualize" what could be done with this. I can see how inducing flux into a transformer core *might* reduce the output, but I can't figure whether there'd be a change in inductance (e.g. whether a tuned primary would be detuned by this), distortion (I'm sure some core materials would distort, but not sure all would), etc. So most of the stuff people have mentioned in reply has stimulated ideas for applications, and that's neat.

Since people have suggested VCO use, I gather inductance change *can* happen. I was also looking with an eye toward variable attenuation and/or AGC.

>stalking??

Well, Gary, the two articles mention "threatening behavior online." Your
comment, "If he doesn't stop that crap, someone is going to do something
nasty" comes across as a very strong online threat, something both
articles speak out against. Just what were you planning on doing to
him? (Hopefully, you're not in Illinois!) 73, Jeff KH6O

Call it what you want to. I'm not splitting legal hairs here. You have repeatedly posted full announcements on the dx packet system to invite net users to your site. Judging from comments within the system, other folks are iritated as well. I've seen the web page and you have some interesting stuff there, but I don't enjoy being reminded of it as much as you enjoy reminding ME about it. DX clusters are intended to convey timely information on that topic. General announcements are made my participants to gather information or to share timely knowledge relevant to DXing. Advertising, in any form and by any other name, is not highly appreciated. Spam is spam.

Has anyone seen a tube-based synthesizer circuit out on the Net? I'm planning a general-coverage rcvr and want to use such a circuit for the first oscillator.

thanks,

Joe W9TXU

On an interview in 1976, I was asked to trace signal flow through a
circuit assembly on a schematic. I did so and got a "Good." I looked
at the guy and said "You're kidding, right?" He said "No. The last guy
I interviewed came in here, through the coupling capacitor, base of
the transistor, collector, load resistor, and followed the Vcc line
across the page."

I used to have a Lafayette Comstat 25 CB rig. Those had a tube based crystal synthesizer. It was channelized which might not be what you are looking for in a general coverage radio. I beleive there were about seven crystal combinations used to generate 25 channels.

> . . .

As a core saturates, increasing the magnetic field strength H (by increasing the current in the winding) causes less of a change in the flux density B in the core. B/H is the very definition of permeability, so as the core saturates, the permeability drops. When the core is completely saturated, it has the permeability of free space (a relative permeability of 1) -- that is, the core "disappears". So a transformer wound on a saturated core behaves like an air-core transformer. In most transformers, this would result in a major drop in the signal coupled between the primary and secondary. Also, the shunt winding impedances would plummet, which would greatly increase the loading on the driving circuit. Another effect, which I mentioned earlier, is that the field isn't any longer confined to the core, but extends over a wider area.

In the case of a single winding (an inductor), the inductance value drops as the core saturates, becoming the inductance of an air-wound coil when the core is fully saturated.

The saturation of a core increases with flux density, which in turn increases and decreases during each cycle of the applied waveform. So saturation will be greater at the peaks of the wave than when it's going through zero. This can result in waveform distortion. Some cores saturate abruptly and some gradually, depending on material and construction. Abruptly-saturating cores will cause greater distortion as they saturate.

You need to be more specific. Do you just need to generate signals every 500KHz or 1Mhz apart, or is this first oscillator going to be the only variable oscillator in the receiver?

Needless to say, synthesizers were around before semiconductors, but you sure didn't see anything fancy in the ham magazines until ICs arrived on the scene. Chances are you won't find anything online, since it's way too obscure, and there isn't much reason to put such circuitry online.

As someone pointed out, one of the more common synthesizer schemes before ICs made it all so much easier was mixing one or more sets of crystal oscillators together. GIven the right combination, you would get variable but with crystal stability. To get in between the channels, one could add a capacitor to one of the oscillators, and make it VXo.

In the late fifties, or early sixties, someone described such a synthesizer in QST, and then later described a somewhat improved version. I can't remember seeing other construction articles along those lines, but I'm sure there were some that described the idea in theory. Note that since you'd be mixing signals together, there will be unwanted signals that have to be filtered out, and back then, balanced mixers were less common. Also, unless the described range was just what you wanted, you'd have to do the math to figure out a suitable conversion scheme (assuming you could find crystals in the right ranges), and redo the filters.

Ralph Burhans had described a PLL in QST one month in 1964, but it was intended for receiving purposes, as the detector.

One of the things you would see was the Barlow Wadley loop (I think it's really named after only one of them, but I can't remember which), which wasn't a synthesizer but was a means of getting an injection every 500KHz. But the cost was two stages of conversion in the signal path (before you got to a vfo fed mixer stage), and that has it's

problems. One was described in 73 in 1867, maybe the December issue. There have beenother construction articles years ago. My Amateur Radio Techniques by Pat Hawker published in 1978 by the RSGB mentions some, though you'd need the original articles for full schematics and construction details.

The fifth edition of the RSGB Handbook (and perhaps other editions) had a section describing a home made receiver with a synthesizer that was tubed based. But it was using the PLL as a filter. Instead of mixing a VFO with crystal oscillators (and have a good filter after that mixer) to get the injection to the first mixer, as some commercial rigs did, you could put the mixing inside a loop, so a VCO was feeding the signal mixer. But in addition to the PLL circuitry, you'd still need a crystal every 500KHz or 1Mhz that the VFO tuned.

I have a vague feeling that I did see a tube based synthesizer that generated singals every 500KHz through the HF spectrum, but I sure can't place it now.

1172. Family Radio Service-UHF Transceivers

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-27 00:00:00 UTC
From: owens@ale.atd.ucar.edu
Message-ID: <8lpnd0$549$1@ncar.ucar.edu>
Source record: 59147

The FRS transceivers are small hand-held transceivers operating around 460MHz using narrow-band fm modulation. I'm trying to figure out how they do what they do with so few chips inside. I pulled apart a defective Kenwood unit to see what makes them tick. Inside I found one chip that looks like it must be the LCD display driver. The other main chip is an 80 pin fine-pitch IC labelled: KENWOOD M382234M4-455GP with a 1997 date code.

There are 2 circuit boards that are sandwiched togetherj aand on the second one is what looks like an IF filter labelled: 21.250 and KDC 89. So maybe it is a single conversion receiver with a 21.25MHz IF. There are lots of 0402 size smt components and one other small 16pin IC and thats about it.

Does anyone know what the architecture of these transceivers is and if perhaps t he 80 pin IC is an asic taht does all the IF functions? Any input on these little radios would be appreciated.

Thanks, Chip, NW0O

To synthesize what?

About the only viable circuit now would be a Wadley Loop.
All the usual references...it works well; I used to own
a Yaesu FRG-7.

I'm always baffled by requests like this. Information does
not magically appear on the net. Somebody must put it there,
and they must have a reason to do so.

The question I ask is simple. Why? To what ends do you make these posts?
Self-importance? Why?
If you can come up with a logical answer, maybe people might take you a little
more serious.

I hears somewhere that it is illegal to use a CB linear on 10 or 6m Ham and
a also illegal to use a 10m/6m linear amp on CB.

Anyone remember hearing this? There were stickers placed on many CB amps of
the 70's saying something to this effect..

Hello.
As coincidence would have it, I recently used the AD536 in a dB-readout circuit of my own. Unless you need the better temperature compensation over a wide temp range, just use a standard 1% 1.06 or 1.07kohm resistor. My circuit does not appear to miss the temperature compensation, when used at room temperature.
But if you find a source for that special resistor, buy several--I'll buy a couple from you!

I had one that looked just like that except it used hall effect transistors
to do the keying. I think it's still in the "pile" around here some where.

Tube based synthesizers did not use the same techniques as the newer ones.
They usually used either a number of crystal oscillators with decade
switches and
10 crystals per oscillator with a mixers and filters or harmonic locked
phased locked
loops. There was a real neat one in the 60's published in the a book called
1001 Circuits by Marcus and Marcus.
The harmonic locked approach is a good one if done correctly. The easiest
scheme perhaps would be to have one harmonic locked oscillator in
increments of say 100Khz
mixed a vfo with a range of 100Khz.

> partially saturate the core of an inductor?

Such devices have been around for years. They are SCRs, or Saturable Core Reactors and used for controlling AC power. They work very well in that kind of service. They've been around far longer than their solid state equivelant.

The more control current the less output.

They do not have the distortion that solid state devices do when used in the same service.

As to using them *strictly* and a control device you should be able to build one that would work,*but* remember that they work by changing the inductance, so one would probably not prove satisfactory in a resonant circuit.

Another thing to watch out for is reaching saturation with part of the cycle which would make it non linear.

Hi,
This is WAY OFF topic, so PLEASE correspond with me directly
to conserve digest bandwidth. I'll be glad to share results.

I have tried to use the line-in ports of my sound blaster cards,
wiring two different HAM radios to left and right line-in.
Both my SB16 with WIN95 and AWE64 GOLD with WIN98 fail same way.
Left channel seems dead, right channel is OK.

A seperate test

I wired the HEADPHONE output of a small battery operated
amplifier to the line_in "ring" contact and the amp ground
to the "sleeve" contact, I can record and playback audio
with WIN95/98 Sound Recorder, RIGHT channel I think.

When I connect amplifier to the "tip" contact and amp ground
to "sleeve" contact, no audio is recorded or played back.

Can SB line_in tolerate DC coupling or do I need to AC couple?

Is cable wiring for SB line_in different than I am trying?
I built my own signal splitter cables and these tested ok
when used as headphone cables.

I really need help.
If my mail is bounced at LAFN address, please reply to me at
dave_shalita@juno.com

Hello Joe

I have not seen anything on the Net, but I have one Rohde & Schwarz
recevier, EK11-10 that uses a tube-based synthesizer or a decade
oscillator as Rohde & Schwarz calls it. It comes in two 19" boxes. It
has 10 kHz as lowest step, then a fineoscillator tunes between 0 -
10kHz. The fineoscillator have an resolution of 10 Hz.
It is a beast to calibrate :-(It contains a huge amount of filters: LP,
HP and BP:s which have to be precisely tuned to eachother, tolerances
0,5dB of some filters, an Spectrumanalyzer with tracking oscillator is
the minimum to be able to calibrate it.
If you are interrested how R+S designed it, I can send you the
schematics.

best regards

Steve:

As I looked at the problem, here's what I will try to implement:

Buffer the AD536A output to drive a voltage divider consisting of a 1K 6% (60,000ppm) NTC resistor and a 19K (or therabouts) metal film. The voltage at the junction of the 1K and 19K should just offset the 3300ppm temperature coefficient of the AD536A. Negative temp coefficient resistors are sold by Digikey in the thermistor category.

I haven't breadboarded it yet ...

Precision Resistor (suggested by AD) is in Largo FL but they have not yet responded to my e-mail.

1197. Anyone modifiy a cheap CB linear for 6m band?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-28 00:00:00 UTC
From: wb8feq@hotmail.COM
Message-ID: <LAW-F166wFRftQqFHTD00007956@hotmail.com>
Source record: 59172

Hi gbowne.

I had to reply to your post and I don't mean to start an avalanch (and pray I don't) fo controversy and pot shots, but I had to reply to your statements.

I can't vouch for the stickers of lack of in CB amplifiers, but I have been a Gen/Adv license holder since 1970 and even though I admit that regulations regarding CB could have changed since then (I don't keep up with them), there WAS a limit of 5 watts power (maybe more with SSB) output on CB transmitters and ANY amplifier with output greater than that ammount (or not FCC type accepted) was illegal on CB (11 meter) transmitters. That is the primary reason the FCC banned the sales of any NEW amplifier in the United States capable of operating on 10 meters out of the box. Prior to this ban most commercial amps were ready to operate on 10 meters and since the input/output matching circuits were broad-band, tuning them up on 11 meters (CB) was no problem.

As for using a CB amp on 10 or 6, part of the regulations governing Amateur Radio allow for the development, building and experimenting of/with radio equipment. This equipment must meet specific spectral pruity regulatiions, but there is nothing that prohibits hams from (legally) obtaining equipment designed for other uses or services and modifying it to operate in the Amateur Bands they are licensed for (providing it can meet the emmissions guidelines). This is one of the reasons that two meter FM is so popular today. Old radios taken out of commercial service due to the fact they no longer met the FCC rules governing those services were modified for use in the ham bands, FM moded gained popularity and commercial manufacturers saw a market and started producing radios that evolved into our shirt pocket wonders of today.

I am not meaning this to be a "Flame Mail" but if the statements you made about not being able to use CB amps on 10 or 6 were true, hams would not be allowed to build or modify at all and publications such as the ARRL Handbook and most ham related magazines would be stopped. In my oppinion, the hobby of ham radio would cease to exist for a great many people as well.

I seem to remember Riley recently ENCOURAGING folks to do this. Seems like he thought getting some of these out of CB service was a good thing. I don't believe it is illegal for a licensed radio amateur to modify anything to use on the ham bands as long as the result complies with the law. However, it is illegal to manufcture an amplifier which can readily be converted to 11 meters. In fact, Part 97 is very specific about this and goes into a lot of detail about what constitutes easily modifiable.

There are also restrictions on how many homebrew/modified amplifiers you can sell to another amateur (one per year), and homebrew/modified includes kits. Probably worth rereading the regs before embarking on this project tho - some of the regs in this area are uncharacteristically specific.

Source record: 59176

```
-----BEGIN PGP SIGNED MESSAGE-----

Here we go, I'm fairly new to the service/hobby and I picked a
reasonable first radio to get started with, a Yaesu VX-5R, which
works quite well. But, while I'd have preferred an FT-100 or
something with a little more oomph, I haven't yet run into
anything I couldn't reach on the 5 watts I have.

I've looked at the catalogs and while the 'docking' station
amps are nice, they seem a bit pricey and don't quite fit my
needs, generally I'd need to have two separate amps and some
sort of switching arrangement. I also could buy a utilitarian
linear for the house, but can't justify the price or the need
for legal limit level power output.

Resistors, capacitors, semiconductors, solder and I seem to
get along together okay, so I would like to build a small amp
that fits my needs, if at all possible. The specs I think I'd
like to find amp plans for would include small, inexpensive
(say under $40 to $50 total cost), connects to the VX-5R and
had maybe 10 to 15 watts out that covers 6m, 2m & 70cm band
operation. Ideally, this would run on 12 volts DC so I could
either run it at home or in the car.

Anyone have a pointer to something like this? Thanks in
advance for any assist you can send my way.

I remember seeing a design for a HF receiver that used
a beam deflection tube as the phase detector in a PLL.
I think it was in one of the RSGB handbooks from the
mid to late sixties.

<< The specs I think I'd
like to find amp plans for would include small, inexpensive
(say under $40 to $50 total cost), connects to the VX-5R and
had maybe 10 to 15 watts out that covers 6m, 2m & 70cm band
operation. Ideally, this would run on 12 volts DC so I could
either run it at home or in the car.

Anyone have a pointer to something like this? Thanks in
advance for any assist you can send my way.>>

http://www.rfparts.com
Get the Motorola RF Data Manual.
RF Parts has alot of other books as well as parts for the project.

Another company CCI (Communications Concepts Inc) has some kits & more info.

You can get a good 75 W or so for $50 if ya have some talent & a good junk box.

Lemme know if you need any info.

Apparently they aren't aware of what many QRPers are doing
nowadays. With as little as two transistors and a crystal, you
can build a transciever. While the performance of a "rig" of
this type is not very good, it'll get you on the air.
The Norcal QRP club published plans for a very good 40
Meter CW rig that only uses 2N2222 transistors. I built one.
It runs pretty well. You'd need about a dozen toroid coils,
some diodes, and 5 crystals, but still, all of the parts new
should be less than $50. Don't know where the file may be
archived. Try K8IQY's homesite. He developed this rig.
This club's memebers illustrate the new "plug-and-play"
mentality that has taken over Amateur Radio recently. While it
is easier to just buy a rig and go..., what have you learned?
If you aspire to become more than the average operator, go for
it.

Bill
W2EB

P.S. With many consumer items being irreparable throw away
items, finding parts is becoming easier than ever. Don't be
afraid to gut an old stereo or VCR for parts.

Minimum purchase $25. Purchase at least $100 worth of stuff (before
shipping costs) and get a 15% discount; purchase at least $250 worth
and instead get a 25% discount. And hey, no Ebay! ;-)

A friend has set up a web site for me to sell off a 28 year accumulation
of electronic components including:

Coaxial Power switch,
RF power and other transistors, RF I.C.'s,
Ceramic 455kHz and 10.7MHz filters,
Minicircuits mixers and power combiners/splitters,
variable capacitors, both panel mount shaft type and trimmer
variable inductors and coil forms, RF feedthrough and standoff capacitors,

High voltage VACUUM RELAYS, HV RECTIFIERS, resistors and capacitors,

Other capacitors including, Photoflash, polypropylenes, tantulums,

Switches, such as foot switches and industrial limit (micro) switches,
Ferrites beads and cores, Transformers and inductors,
and lots, lots more.

Dont listen to what those "appliance operators" have to say...if YOU want to build your own station DO IT. The key here is that you want to do it. Find the info you need and locate a person or persons to help you along and have at it. I have found over the years that people are generaly very generous in this area once you locate the right ones. It sounds cliche but if Columbus had listened to the nay sayers things could have been a lot different!

1208. Grounding

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-29 00:00:00 UTC
From: Louis Long <louis_45439@hotmail.com>
Message-ID: <E5Kg5.4644$kMx4.85197188@news.randori.com>
Source record: 58949

I have a question about grounding. I am in a basement/lower level apartment. Because of rules, I can't put anything up outside, and because of space I have to use mobile antennas with mag mounts inside. I have a small, old, metal filing cabinet close to a window. If I place the mag mounts on the filing cabinet, can I sufficently ground it by soldering a ground wire to the cabinet and grounding it to a nearby outlet plate screw?

Thanks in advance.

One thing to keep in mind was cost $$$$$$$$$$.

While, in theory, building is a great idea the fact is one can
purchase used rigs at a fraction of the cost of building.. I feel that
those who advised against building had cost primarily in mind....

As a builder myself I prefer making my own, however, as the cost
factor comes in to play it's a different ball game.

That's why I have sop much "store bought" stuff.

Greetings,

Went to my 1st local Ham club meeting tonight.
Everybody was nice. Several times I mentioned that I'd
started out with the idea that since I was poor and had no
ticket as yet that maybe I'd try to homebrew my "rig" to
save money. Everybody said, " Forget it! Way too advanced
and not worth it! "

Opinion was,.... Just get ur license and buy some old
boatanchor to go on the cheap. Homebrewing's for advanced
only. Just get ur ticket, pass the morse (if u want more access
to CW), then maybe, after ur expert, try to build something. Are
they right?????

Andrew

you can get on the air with a very simple transmitter, and almost as simple reciever, but your capability will be limited. For the cost of finding and purchasing the parts to build the transmitter and reciever, it is better to buy a used transciever that is commercially built which will make operating in several modes more enjoyable. Then, after that you can take the time to build one. A simple cw transmitting rig is easy to build, and reception can be done with a reciever with bfo capability, but dont let poeple bother you with their 'plug and play' jibes, low coat rigs are easily had and much more enjoyable in the short run. It is all a matter of choice.

1215. Parts and Tubes for Sale - 7/28/00 list

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-29 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <20000729072616.04379.00001697@nso-bk.aol.com>
Source record: 59183

I have the following parts for sale. Too much stuff, not enough basement. Shipping (from 19087) is not included. Prices shown are asking prices for single units - let's make a deal! Big discounts on quantity purchases. Shipping weights are estimates - you pay only actual shipping charges.

Modulation Transformer

Thordarson 7994 plate-and-screen modulation transformer. This is an upright transformer of the pre-WW2 Thordarson style. Looks like it could easily handle 50 watts of audio. I have NO information on this transformer - any and all help appreciated! In fair-to-good condition. Asking $5 (8 lbs.)

Power Transformers (all have 117 V 50-60 Hz primary)

UTC H-196 power transformer. Upright, hermetically sealed mounting style with ceramic insulated lugs on the bottom for connections. Meets MIL-T-27A. This transformer has two ratings. Military Rating: HV: 230/285VCT @ 445/380 mA HV, 6.3V @ 5 A heater #1, 6.3 V @ 1.5 A heater #2. Industrial rating: HV: 230/285VCT @ 480/420 mA HV, 6.3V @ 6 A heater #1, 6.3 V @ 2 A heater #2. NOS, in the original box, absolutely MINT condition, a beautiful mil-spec unit. Will test if desired. Price $25 (12 lbs.)

Stancor PC-8417 power transformers (Have 2). Upright mounting style (no big chassis hole to cut). Secondaries: 440 VCT @ 50 mA HV, 25.2 V @ 0.5 A heater #1, 6.3 V @ 0.6 A heater #2. Mounting centers 2 X 1-9/16 inches. NOS, in the original boxes, absolutely MINT condition. Will test if desired. What makes these transformers special is that they are just right for building a power supply for an unmodified "Command set" (ARC-5/SCR-274N) receiver. Heater winding #1 is just right for the heaters of an unmodified Command set receiver, and heater winding #2 is just right for a 6X5 or 6X4 rectifier. Using one of those rectifier tubes and a capacitor input filter, the DC output voltage should be about 220 volts at 50 mA. Of course they can be used for other purposes, but the ratings are a perfect match for a Command set receiver. Price $12 each or both for $20. (4 lbs. each) Will include 6X4 or 6X5 rectifier tube and socket (your choice, no charge) if you need them..

UTC R-7 power transformer. Horizontal, "hole in the chassis" style with terminals. Secondaries: 700 VCT @ 100 mA(?) HV (current rating not marked, but at least 90 mA), 5 V @ 3 A rectifier filament, 2.5 V @ 8 A heater #1, 6.3/2.5 VCT @ 2A heater #2 (tapped so both voltages can be used). Used, dusty and a paint is scratched up, fair-to-good condition. Tested, works. Price $4 (5 lbs.)

Filament Transformers (all have 117 V 50-60 Hz primary)

Thordarson 6421 rectifier filament transformer. Antique upright style (from 1930s) with solder lugs for connection. Two independent secondaries: 5 V@ 3 A, 2.5 V @ 10.5 A. Used, tested, works, good condition. Price $3 (4 lbs.)

Variable Transformers

Superior Electric "Powerstat" variable autotransformer (similar to a Variac). Model 116-U. Input is 115V, output can be connected for 0-115V or 0-135V, continuously variable. Rated 7.5 A output. Open type, panel mounting with 3/8" shaft, no scale provided. Can be connected for CW or CCW rotation, instructions on terminal board cover. Used, tested, works, good condition. Price $25 (10 lbs.)

Meters

Meter from military I-166 multimeter. Round black bakelite case, white face with scales. 0-100 uA movement. Labeled "calibrated for use in steel panels". Price $5 (1 lb)

Tubes

NOS tubes in original boxes. All are $2 each or 6 for $10. Manufacturer in parenthesis, Quantity in brackets:

6AG7 (RCA) [3] (In special military long-term packing)
6AU5GT (Sylvania) [5]
6BL7GTA (GE) [1]
6SA7GT (RCA) [1] (in plain military box)
6SQ7GT (Raytheon) [6]
6V6Y (RCA) [1] (Metal tube with low-loss micanol base for RF use)
6080 (RCA) [1]

Miscellaneous

Snap Switch - A real antique, surface mount switch meant for house lighting but perfect for antique-style power supply on wooden chassis. Rated 10 A @ 250 V. Round white ceramic base with snap-on brown bakelite cover. Screw terminals inside, wiring is done via holes in the base. 2-1/2" round, DPST with double-break contacts. NOS, excellent condition. Price $2 (1 lb).

Octal Wafer Sockets - Brown phenolic. Have 9 NOS, VGC, 1-5/16 mounting centers, 25 cents each. Also 3 used, GC, 1-1/2" mouning centers, one with pin 6 missing, 10 cents each or free with any order. $2 for all 12. (1 lb.)

160 Meter Wave Trap - J.W.Miller Type 811-A. This is a parallel tuned circuit consisting of a pi-wound inductor that is mounted on a mica compression trimmer. Put in antenna lead of AM radio to eliminate BCI from nearby ham stations. NOS in original box. 25 cents (1 lb)

Sonalerts - Model SC 628 Sonalert device by P.R. Mallory. Require 6 to 28 VDC @ 3 to 14 mA. Produce 2500 Hz tone at 68-80 dB SPL. Unused, tested, working, very good condition. Have 3. Price $1 each (1 lb)

Control Box for Alliance Tenna-Rotor. Classic unit from early '50s - sloping front brown bakelite case with meter. Old, beat up, cracked and glued case, some parts missing - a real bottom-of-the-junkbox find. Transformer, meter and switch assembly good. Price 10 cents or free with any order. (2 lbs)

Code Practice Oscillator Module. CPO-4 made by Carl Conover & Co. Mineola, NY. Classic unit from the early '60s - "All American Made!" Consists of a small circuit board with two transistors, one resistor and one capacitor, to be hooked up to a soeaker, key and 1-1/2 volt battery. NOS, still in original plastic bag. Looks like something you'd find at Lafayette Radio in 1962. Price 10 cents or free with any order. (1 lb)

Please feel free to email with any questions, and to make an offer for some or all of this stuff. More to come, too.

7/28/00

Not necessarily. You can certainly do it that way, which makes it easy to
get up and running, but if you really want to roll your own, I'd suggest
starting with one of the kits (qrp most likely) to get up and running. It
does depend a bit on your skills, electronics knowledge, soldering
ability and equipment etc. If that's what you want to do, go for it.

The other piece of advice that everyone else left out, don't bother joining that club! Obviously no one there will be able to help you with any problems you might have in building your new station!

Well, that might not be inaccurate if the power decoupling was really
poor. Admittedly, *really* poor.

;-}

Jim's website is http://www.qsl.net/k8iqy. Complete instructions for building the rig are there, although if you can a reprint of the QRPp article it would be a lot better. I built mine entirely from Jim's web page and it was fairly hard. But after seeing the QRPp article, I'd be surprised if anyone who was reasonably careful couldn't duplicate it. The article is really good. I needed a fair bit of elmering from various folks, due mainly to my lack of test gear. It could be a little tough if the local club is as you describe, but if you're not shy about asking for help on QRP-L, you should have no problem.

This rig is a lot better than "pretty well". It is only one band, but 40 isn't a bad choice. And it is only about 2.5 watts. But the receiver is second to none. When I fire up my $1500 Icom I keep wishing it had a receiver designed by Jim.

I think $50 may be a tad low if you have no junkbox. I expect you'd be closer to twice that in parts, assuming you don't have access to some good hamfests. A junkbox, a few good hamfests (Dayton or Findlay class), and/or some very careful purchasing could get you closer to $50. You will need the basic tools, a good soldering iron, needle nose pliers, diagonal cutters, a reasonable meter, and an RF probe (easily home brewed).

Another choice might be Norcal's SMK-1. Again 40 (and again, not bad but not my first choice), a lot simpler and cheaper ($34 shipped), but a lot more frustrating to make contacts with, especially for a beginner. Takes good eyesight and a really steady hand. But a LOT of fun for few $$.

Building your won stuff, even from a kit, is a lot of fun. Maybe the most fun in ham radio. Don't miss it. There's nothing quite like that first Q on a homebrewed rig.

You don't have to build an "advanced" rig as your first
project. Your homebrew rig can be as simple or as
complicated as you like.

My first HF rig was a 20M CW transmitter. My second rig
was a single band SSB/CW rig. My current rig is a
9 band SSB/CW rig.

I've seen a FOUR-xstr rig, but not a TWO-fer.
Can someone give any more details (or even an ASCII schematic)?

Cash4Surfing

I found this on a bulletin board and decided to try it. A little while back,I was browsing through newsgroups, just like you are now, and came across an
article similar to this that said you could make thousands of dollars within
weeks with only an initial investment of $6.00! So I thought, "Yeah right,
this must be a scam", but like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups.
(There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured,

"What
have I got to lose except 6 stamps and $6.00, right? "Then I invested the
measly $6.00. Well GUESS WHAT!?...Within 7 days, I started getting money

in the mail! I was shocked! I figured it would end soon, but the money just
kept coming in. In my first week, I made about $25.00. By the end of the

second week, I had made a total of over $1000.00! In the third week, I had
over $10,000.00 and it's still growing. This is now my fourth week, I have
made a total of just over $42,000.00, and it's still coming in rapidly.
Let me tell you how this works and most importantly, WHY it works.
Also, make sure you print a copy of this article NOW, so you can get the

information off of it as you need it. I promise you that if you follow the
directions exactly, that you will start making more money than you thought
possible by doing something so easy! Suggestion: Read this entire message

carefully! (Print it out or download it.) Follow the simple directions and
watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (plus postage)

IMPORTANT: This is not a rip-off, it is not indecent,
it is not illegal, and it is 99% no risk - it really works! If all of the
following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: please follow these directions EXACTLY, and
$50,000.00 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You
will
now become part of the Mail Order business. In this business, your product
is
not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to for quality
lists.
However, the money made from the Mailing lists is secondary to the income
which
is made from People like you and me asking to
be included in that list. Here are the 3 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write your name and address plus the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING

LIST."
Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent (thievery).
Next, place one paper in each of the envelopes and seal them. You should

now have 6 sealed envelopes, each with a piece of paper stating the above
phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all.
So
I
checked it out with the U.S. Post Office 1-800-725-2161) and they confirmed that it is indeed legal.

Mail the 6 envelopes to the following address:

1. Julius Tausaga, 2006 A.Fern St. Honolulu, Hawaii 96826
2. Steve Dixon PO box 511 Fairview NC 28730
3. Dan Polzin 7409 Wallingford St. Louis Mo 63121
4. Richard East 356 Grove Ln, Murray, Kentucky 42071
5. Jack Dukeshire 2 Army St, Randolph, MA, 02368
6. Bradley McMillan, RR#4, Winchester, ON, Canada, 12541

STEP 2: Now take the #1 name off the list that you see above, move The other names up (6 becomes 5, 5 becomes 4, etc.) and Add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money YOU make! You won't get very much unless you post like crazy. This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of

integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be

receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now,
add
your own name to the list and you're in business!

---DIRECTIONS----FOR HOW TO POST TO NEWSGROUPS---------
Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter, drag your
cursor to the bottom of this document, and select 'copy' from the edit menu.
This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of the
blank page. From the 'edit' menu select 'paste'. This will paste a copy of
the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your
postings in different settings, you'll always have this file to go back to.
Step 4) Use Netscape or Internet explorer and try searching For various newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new message
by
highlighting the text of this letter and selecting paste from the edit menu.
Fill in the Subject, which will be the header that everyone sees as they

Scroll through the list of postings, in a particular group. Click the post
message button. You're done with your first one!
Congratulations. THAT'S IT! All you have to do is Jump to different newsgroups and post away. After you get the hang of it, it will take about
30 seconds for each newsgroup! (There is a faster way. You may use Microsoft
Outlook or Outlook Express to select newsgroups rapidly. You just need one
time "Copy and Paste" to send to all of them simultaneously.)
**REMEMBER,
THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT: YOU HAVE
TO POST A MINIMUM OF 200** That's it! You will Begin receiving money from
around the world within days! You may eventually want to rent a P.O. Box

due
to the large amount of mail you will receive. If you wish to stay
anonymous,
you can invent a name to use, as long as the postman will deliver it.
**JUST
MAKE SURE ALL THE ADDRESSES ARE CORRECT. **Now, each of the 5 persons
who
just sent me $1.00 make the MINIMUM 200 postings, each with my name at
#5
and only 5 persons respond to each of the original 5, that is another
$25.00
for me, now those 25 each make 200 MINIMUM posts with my name at #4 and
only
5 replies each, I will bring in an additional $125.00! Now, those 125
persons turn around and post the MINIMUM 200 with my name at #3 and
only

receive 5 replies each, I will make an additional $625.00! OK, now here
is
the fun part, each of those 625 persons post a MINIMUM 200 letters with
my
name at #2 and they each only receive 5 replies, that just made me
$3,125.00!!!Those 3,125 persons will all deliver this message to 200
newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625.00! With an original investment of only
$6.00!
AMAZING! When your name is no longer on the list, you just take the
latest
postings in the newsgroups, and send out another $6.00 to names on the
list,
putting your name at number 6 again. And start posting again. The thing
to
remember is: do you realize that thousands of people all over the world
are
joining the Internet and reading these articles everyday? JUST LIKE YOU
are
now! So, can you afford $6.00 and see if it really works? I think so...
People have said, "What if the plan is played out and no one sends you
the
money? So what! What are the chances of that happening when there are
tons
of new honest users and new honest people who are joining the internet
and
newsgroups everyday and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, everyday, with thousands of those joining
the
actual Internet. REMEMBER, play FAIRLY and HONESTLY and this will
really

work. The possibilities can be endless...You will never know, unless
you

give it a try... otherwise, it will always be "what if."
GOOD LUCK!

> 1149 rec.radio.amateur.misc
> 527 rec.radio.amateur.policy ..."
>Let's see: 2505/12 is roughly 200 messages per month.

Or about 6-7 per day. And this one *single* message alone will count
as five. I notice that you append "x-no-archive: yes" to the header of
each of your articles so that no count can be made of your postings.

>I'm sure that each and every one of those was necessary ...

Conversations go back and forth; do you keep a count of the
number of verbal responses you give per day? Are each necessary?
That you've responded to me means you yourself just posted five
articles (one to each newsgroup in this new thread you've started).

Many of us on here are ham radio operators -- we're communicators --
on here that involves posting responses, and responses to responses.
Do you understand?

Now, answer the query I posed in my earlier message to you. Why do those newpaper clipping bother you so much?

Jeff

If your query is directed to me, several hundred of those posts are due
to the posting of FAQs and charters to the rec.radio NGs. And this single
post, written to answer your concern, will count as five posts due to you
(or someone else) x-posting it to five NGs. I'd trim it down to a single
NG if I knew which of the five groups you were on.

By all means build a rig, but not just any rig. Depending
on where you are crystal-controlled rigs can be just
exercises in frustration. Frequency agility is essential with
QRP - don't consider anything without a VXO at least.

Remember that you want to be able to make random contacts,
and not have to phone someone first to get them to listen on
your crystal frequency.

See the following for the TRUTH about homebrew rigs (that many articles
gloss over):

http://www.alphalink.com.au/~parkerp/qrpgear.htm

http://www.alphalink.com.au/~parkerp/nofirst.htm

You will see many claims for rockbound rigs. Most are true. However,
do they pass the 'two-week test' - ie is the constructor still using it two
weeks after completion? No. 99% of crystal-controlled rigs sit on the
shelf
gathering dust. In contrast, a VXO rig, with at least 10 or 20 kHz shift
on a band like 40m will provide dozens of contacts and is hardly more
complex than an xtal rig. You will easily get contacts up to 3000 km on
it and will want to take it anywhere you go.

73,

Peter

Andrew,

It is MUCH easier than you think. Some of the old boys will
try to make it appear difficult just to appear important.

Get yourself a pair of side-cutters, a small soldering iron,
a reel of resin-cored solder, a reel of 16, 18 or 20 gauge
enameled (magnet) copper wire, a cardboard toilet roll tube
and a used razor blade.

Visit the nearest radio junk merchant and haggle for one or
two 300-500 pF variable tuning capacitors. Get a few
wire-end diodes, silicon or preferably germanium. The
hardest thing to find is a pair of high impedance
headphones, resistance = 2000 ohms.

Within an hour or two you will have built your very first
radio receiver and you will have learned more in the process
than 6 months listening to old-timers like me.

Now get on with it !

1230. Caution - Stay away from DWM Communications!

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-30 00:00:00 UTC
From: Newswatch2 <newswatch2@my-deja.com>
Message-ID: <8lvs93$42c$1@nnrp1.deja.com>
Source record: 58955

To All Readers:

DWM Communications website can be found here:

http://www.qth.com/dwm/

AVOID Tiny-Tenna and buying ANYTHING from DWM communications. Not that the products themselves are bad (although many say they are!), but DWM communications is actually a terroristic organization similar to the Scientologists. If you say something they do not like publicly, they will pursue you with their lawyers, tell lies to your employer, and do everything they can to smash your reputation. Ask the folks in rec.radio.shortwave!

Take a look at the spamming going on in rec.radio.shortwave. All of it is originating from DWM communication staff. They are currently attempting to disrupt and destroy many radio-related newsgroups through repeated, malicious spamming.

The president of the company, Bill Lauterbach, entered r.r.s. for the purpose of threatening, terrorizing and spamming the group.

If you give your personal information to DWM Communications, Inc. they will most likely abuse it, and may even give it to others! This company (that makes the "Tiny-Tenna") is UNSAFE TO BUY FROM, and if you buy from them you are risking not only your money, but your sanity and peace of mind as well!

You should note that this company also advertises freely on radio stations that promote fascist and racist material and carry such programming. This makes the company a racist organization, and if you buy from them you are supporting racism!

The "Tiny-Tenna" product is simply $5.00 worth of parts that anyone could build themselves, even a child. Yet they charge $19.95 for it, making a probably 400% markup.

Take this as a warning, and NEVER buy anything from DWM.

DWM's website can be found here:

http://www.qth.com/dwm/

Their phone number is 1-517-563-2613

Their address is: P.O. Box 87-W, Hanover, MI 49241

DO NOT ORDER FROM THIS COMPANY!! You will be risking a lot, and it is not worth it! Keep your sanity, your peace of mind and your money, and

order from another company instead!

If you are wise, please contact the company and let them know how you feel about the spamming going on! And above all, avoid ordering from this company at all costs! It will be the biggest mistake you have ever made in your life!!!

Sent via Deja.com http://www.deja.com/
Before you buy.

Fully 480 of them are due to the posting of the monthly FAQs and charters.
I'd gladly turn that duty over to you, if you promise to maintain those
documents to the fullest extent possible.

>I'm sure that each and every one of those was necessary ...

At least 480 of 'em are. That leaves 725 -- less than 2 posts per day.

Jeff

--

No. You can go in the other direction. That is, you can make
a 78L08 work at 15 volts. If you can find the TO-93 version
of the LM317, you can make it work at 2 volts. Another trick
is to use 3 forward biased 1N914 diodes as a 2.1 volt zener
diode.

No, a fixed regulator is not designed for this purpose. Not knowing the load current you need, if it's low, you can use three silicon diodes in series with a limiting resistor. The P/N junction of a diode will develop very close to .7 volts and provide surprisingly good regulation. Thus, 3 diodes in series will regulate very close to 2 volts. This is not a high current application due to the limiting resistor.

You probably don't need a ground at all, if you are operating at VHF. For HF, you won't have enough signal out of the room to work anyone farther than down the block.

Spoken like someone who has never had to work out of an apartment with a stealth antenna. The 10 meter dipole I have strung up along the ceiling of my apartment has made contacts all over the US. I am experimenting now with it having slinky's hung from each end to move it to 20 meters. I also have an opposable whip mount, which allows me to put two matched mobile whips together as a dipole, currently I have 12 meters mounted but I also can go with 40 meters with my other whips. What matters is being able to make contacts with what you can make work. Not everyone can put up a monbander stack on a 60 ft tower. If he works psk31 he will be able to work around the world since that mode lends itself best to minimal equipment. Thank God that the kilowatt crowd never have warmed up to psk31.
thanks, John.

Grounding the file cabinet will not really add any to the mag mount performance and is not required. The metal of the file cabinet will provide the ground plane "effect" for the vertical to resonate properly. The same thing can be accomplished with a big pizza pan. Think about it, does the mag mount actually make any metal to metal contact with a car's body....is the car grounded....the metal of the car body only provides the pseudo ground plane effect. The file cabinet may not work as well as a large mass of metal, such as a car but the antenna will work.

You don't have to sell me on this, back when the only radio I had was an htx-202 I could get several s units better reception if I set the radio standing up on my oven, instead of sitting on the kitchen table. Even a duck antenna benefits from having a good metal lump to work against. Later when I got an ultra short vertical whip for 10 I tried it on my refrigerator, it worked, just not as well as it did on my car. A mass of metal at hf is more likely to function as an image antenna than a ground plane, just as the grounded side of a dipole works as the image of the driven element.
thanks, John.

Source record: 58969

Howdy Andrew....Its GREAT to hear of your interest and see the POSITIVE responses you got....I also say "Go for it" if thats your interest....Might add that "one" way to achieve success with a simple rig is indeed to use morse as a means (CW for a mode) - Let your brain and skill be part of the process. I sure remember the great fun my buddie and I had in our early days listening on a super regenerative solid state receiver (early FET) that he built.... my first attempts were to retune broadcast receivers to 160 meters and feedback their IF chain to cause them to oscillate (to hear CW and SSB)....A 2 transistor AM broadcast band TX made myself heard quite a few miles away on a freak reception by a local ham and the rest is history. Even back in those days (1969, 1970) and thereafter as I finally got my ticket in 71, I was discouraged from building my own gear, at the local ham club (prob is NOT new)....However the reasoning was indeed that a cheaper quicker way was to get a used rig - TX cost me 40 dollars and a receiver was given....dipole built....Homebrewed "accessories" were the T/R switch (manual toggle in a box w/SO-239 connectors etc), dummy load. We used to have "auction" night at the local ham club, with lots of NOS and used parts being all but given away (this type of stuff sorely missing at modern clubs). In a way, as a (then) 11 or 12 year old fellow, I likely was guided the right way as I didn't have nearly enough skills to even do rudimentary successful work on scratch built gear. Your perceived progress (depending on your age, experience) "might" not be a bad way either - follow your desire - You WILL SEE MORE OFTEN the dreaded way a lot of "hams" (cough) have become....that wasn't our roots.

Have fun - Learn - DON'T use expressions unless you find them to be true and know their origins, KEEP ON TINKERING....THAT....is real ham radio.

Message-ID: <397B15A0.62E6@nbnet.nb.ca>
Source record: 58970

Or just 3 or 4 silicon diodes in series (heck with the series limiting resistor)....this could suffice (depending on the diode ratings) for even substantial loads. In practice, I've often found modern silicon diodes to show junction drops (fwd biased) to be more like .55 to .6V so you might have to play with either 3 or 4 depending on which side of safety you can err. On the question of making an existing "higher" voltage 3 terminal reg work as a 2 volt regulator, only way I can think that this might work would be to put it in constant current mode AND in shunt across a supply to ground......seems that a constant voltage drop of about 2 volts is available from input to output in this mode - Any takers on this?

Best of luck!

Gord - VE1AJF

Message-ID: <VA.000000bf.008b487b@xic.demon.co.uk>
Source record: 58972

Hi,

Has anyone an old catalogue from the subject company. A friend
of mine has several transformers that are larger and heavier than
the marked ratings would seem to require.

Type : TF4RX03YY
Other Markings : 672-1316-00 and CSTC 27540
Ratings : Primary Dual 115V @ 0.87A total
Secondary 30-0-30V @ .500A DC
Dimensions : 5" x 3 1/2" x 3" approx.
Weight : 2.5 kg approx.
Measured sec. resistance : 1.2 ohms per section

As you can see the efficiency and weight are not what one
would expect from such a low-power transformer. They were
stripped from an antenna switching unit where they powered a
couple of relays.

Tks es 73 de Joe, G3LLV

1248. Putting the SB-220/221 on 6 meters

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-30 00:00:00 UTC

Message-ID: <4mp8osg3s0ag5ksi6i4ohlpjf2dh64s6t6@4ax.com>
Source record: 58973

I have tossed together a web page which attempts to provide a
step-by-step guide to converting the Heath SB-220/221 amplifiers over
to 6 meter only operation. There are pictures (such as they are)
included to clarify the procedure.

If this should interest you, please go to
www.agate.net/~ns1z/sb220.html
and look it over. Should you have suggestions on improving this
reference, I would appreciate hearing from you. Like antenna work, a
web page is never done......

If you use my page to do a conversion, let me know how you make out.

Have Fun!

NS1Z FN44rn (for those of you with ICBM capability.....)

I would think the problem would be sitting that close to an antenna
putting out that much power.

Any malfunctions can be corrected (computer reset) by disconnecting the battery for a few minutes. Also if you go out of your way to isolate your wires/cable with rf shield sold at any good shop, you'll minimize any potential problems. (I have a 99 Toyota prerunner)..... FYI

I have been hunting for a data sheet for a phase detector chip - the uPC1008 - but without any luck - Can you point me in the right direction please?

It is used in a Yaesu transceiver that I am modifying and what I am most interested to find out is the maximum operating frequency for such a chip.....

Many thanks for your trouble ....

Gudmundur

Don't know the answer; but I recall somebody trying this some 50 years ago and claiming that 'normal' alkaline batteries (ie. cells) did regenerate. No information or numbers about how effective or how many times they could do it. Sorry that's all I can recall. Was it 'D' cells (then called U2) they tried it with? I'm not sure.
I believe the reason they tried and I seem to recall an article in some magazine such the British "Practical Wireless", was the shortage and cost of batteries in post-war Europe. On the other hand there was lots of surplus gear on the go!
Any encouragement?
Terry S.

I've done it, but not on purpose, it sounds a lot like a .22 going off.
<grin>, and yes you are correct, the voltage is closer to .55 to .60.

Hi Brian,
Any LM317 will go down to 2 volts (down to about 1.3volts, actually);
that's the easiest and simplest way that I know of (and still have
substantial current output). I've done it before, to supply ECL logic
with a 2volt bias, so I know it can be done!

What kind of lifespan do you expect the alternator to have? If you are still running the stock electrical system you are overstressing the alt/volt reg. Most stock electrical systems are in the 60-80 amp range, and you will be pulling that just with the amp and radio running. Leaving nothing to charge the battery, or power the ignition system and acc. You better think about buying a high capacity alterantor like welders or the guys with high power audio use. Get something that can put out 150-180 amps while running cool.

You may find your cw signal gets a cleaner tone with the voltage not dropping as you key. No more people hearing doweep doweep tones instead of dah dah.
thanks, John.

1273. looking for tube-based synthesizer circuit - clarification

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-07-31 00:00:00 UTC
From: joer@reda.com
Message-ID: <5i7h5.1620$xq3.312570@den-news1.rmi.net>
Source record: 58998

It occurred to me I probably wasn't very clear in my earlier posting.

What got me started on this was an article in CQ magazine of Sept. 1966. Kirchner, VE3CTP published an article, "A Phase-Locked Oscillator for Advanced Receiver Design" that describes a phase-locked local oscillator that produces output up to beyond 30 MHz in 500-kHz segments. He did it rather simply (appears to me) by generating harmonics of the 500-kHz oscillator, sending those and the output from a VFO into a phase detector and using the error signal to varicap-tune the VFO on to lock.

As per the article: "Q1 is the 500 kHz oscillator. Q2 and Q3 comprise a Schmitt trigger producing square waves at the rate of 500 kHz and rich in harmonics. Q4 is a phase inverter; Q5/Q6 and Q7/Q8 are impedance step-down stages to increase the efficiency of the phase detector. DC output from the phase detector is applied to DC amplifier Q9 and its output is applied to the phase detector. (Q10, 11, 12 are used to indicate lock). Q13 is a buffer for Q14, the VFO and its output is also applied to the phase detector."

I had it in my mind to replicate that circuit using tubes and was more curious if anyone had created a similar circuit. I'm looking to build such a circuit to act as the second oscillator in a double-conversion RX that'll tune from around 100 kHz up to around 30 MHz or so.

regards,

Joe W9TXU

I can't help with he junk box parts, but I built one of those amps, but made it multi band. It was a bear to neutralize, but worked great. I put screen voltage on it, but tied the screen and grid to RF ground and fed it grounded grid. I could turn those 813 plates bright red and was really happy with it.

Course back then I could buy the 813s for $5 each.

To Gord, et al,

I AM amazed at all the help offered here. After asking some questions
under the heading "Total Newbie" (and getting great advice), I had wandered
over to rec.radio.shortwave, partially because recieving is all I'm capable of
right now. The many postings of that group can keep one occupied for many an
hour. One poster here, I think, correctly picked up on my anxiety over this new
interest of mine. True Confession: I often pick up some interest only to drop it
3 months later. I'm trying not to do that this time around.

It's probably not completely fair of me to mark everyone at this meeting
as "plug 'n play-types" since it was my 1st Ham meeting. Nonetheless, it was

obvious that no one in the " Stand up and share with the group" segment had anything to say about homebrewing. Not even having my ticket yet and knowing very little as yet, I was very apprehensive about saying something like, "Hey, doesn't anybody here like to *build* stuff?"

Everyones' helpful replies here have helped me to again re-affirm what are my main reasons for interest in Ham Radio. They are; DX'ing those hard-to-get stations in the far flung corners of the world, extending contacts of my own and maybe having my own collection of QSL cards. Building is a real challenge for me as I can't even hammer a nail straight (thankfully not too many nails in most radios-- grin). Also, frankly, I have a real lack of cash and cannot afford to do *too* much beyond building.

No offense meant to others, but ragchewing for hours on 2-meters about my "rig" means nothing to me. Landing a QSO with a Ham in Archangaelsk, Russia sounds much better. The kinds of thing you can homebrew seem pretty compatible with this kind of thing.

I'm going to my first hamfest on Aug. 6th. Can I expect to find kit dealers there? I plan to take my Technician's exam then. I could probably be ready for my Morse, but lack a practice osillator or key to work on. I plan to pick up these too. Any advice the group wanted offer on what to look for and what to look *out* for would be most welcome.

In the meantime, I've also been invited to a local QRP club meeting to be held in Sept. and will be eager to compare the two clubs. You can be sure I'll be posting on my progress. So a huge THX to you and all those others who have so gratefully and patiently given of your knowledge and advice. You are most honorable folk.

Andrew

Unless you have a large junk box of components and access to good test instruments, I would suggest that you buy or loan some used equipment (or at least a general coverage receiver). Once you have this system working (by making some successful QSOs), you can use this system as a reference system when homebrewing your own equipment.

If you start directly by homebrewing your first station, it can be very frustrating when you have no way of telling if the problems are associated with your homebrew effort, your antenna or your operator skills. With a station known to be working, it is much easier to try out your own work by replacing some functionality of a working station, e.g. use your own homebrew transmitter, while still relying on the receiver from the original station.

A general coverage receiver (or the receiver part of a tranceiver) with somewhat dependable frequency display is a great asset when homebrewing your own station for validation of operation of your homebrew system (checking that an oscillator is working, checking for spurious radiation etc.). While a grid/gate/base dipper and a digital frequency counter is equally useful, the general coverage receiver is more versatile, since it can also be used to receive transmissions from other radio amateur stations and not just from your own :-).

In home brewing there is always the possibility that something goes wrong (bad solder joint, missoriented components, faulty components) and if you have no means of determining where the problem is, you end up replacing components at random, which is very frustrating.

The ideal situation would be that the local club had a sufficient amount of suitable test equipment, but if no such equipment exists, you should be prepared to invest in your own test equipment, thus, homebrewing your first station is not necessary any cheaper than buying some used equipment.

There are many hams who have started with too ambitious projects and when some problems pops up, they have not been able to solve them and

they have given up ham radio completely due to the frustration. In order to avoid such situation, I think it is better to get a system that is known to be working and incrementally replace it with your homebrew system.

It may sound that homebrewing is very hard and that the risk is high for failures, but there are various kits with required components and a step by step instructions of building them and usually only a multimeter (and often a simple diode probe) is required to align them by the provided step by step instructions. These are easy to get to work, but such kits are often more expensive than a ready made similar system, so they are not necessary any better than used equipment from the low budget point of view. Anyway, if you don't have a junk box of components, which is usually the case with new hams, kits are a better alternative than starting from scratch, in which case obtaining the components from various sources can be hard.

Hi! Jerry. Good info; thanks.

Also see other posts on this subject; one of them states that 'rechargeables' are the same or similar in construction to 'regular' alkaline cells. They are not talking about your Nife or Nickel-ferride batteries of course, but that's interesting!

Roger your comment about 9 amps. Pow! Splat! etc. But there is/was an article somewhere in some fairly reputable magazine such as "Ham Radio" some 5 to 8 years, I think, that talked about reactivating (rechargeable) cells by giving them an initial 'jolt' e.g. a few seconds at an amp or something and then recharging at a few milliamps.

Thanks for the comments.

Terry S. Eastern Canada.

BTW. Next year 2001, celebrates the 100th anniversary of Marconi receiving the first trans-atlantic wireless message on Signal Hill St.John's Newfoundland; a few miles from here. SONRA "Society of Newfoundland Radio Amateurs" will staff their site on Signal Hill to commemorate. < www.webhost.avint.net/SONRA >

PS. I keep a few supposedly rechargeable cells and a cheap recharger on my kitchen counter. The few cells I recharge seem OK for occasional use; e.g.. small flashlight. But I agree the capacity after recharging does not seem to be anything like as good as original but I've not done any tests to prove or disprove. We also replaced the cells in a cell phone battery with a bunch of AA rechargeables; worked OK.

PPS. BTW did you ever see those military cells where you added water to activate. The ones I saw were generally about two inches square and 5 to 6 inches high and were 1.5 volts? I guess they were a dry alkaline?. I believe there were US and British versions; can't remember a type number.

For $40 to $50 you would be lucky to get a couple of new power devices to use. I went through the same exercise myself when I got my first dual band HT (2m/70cm). However most solid state power devices are designed to cover a small band of frequencies. The matching technique used at 6m probably will not work at all on 70cm. You may end up with 2 or more amplifiers to cover all three bands. If you do find a power device that provides enough gain on 70cm, the gain maybe too high on 6m for a stable amplifier, i.e. the amplifier may want to oscillate REAL easy. This complicates the design by requiring a gain compensation circuit which is frequency dependent, and or neutralizing circuits.

My solution was simple. I went to a few local ham swaps and picked up a used Mirage BD-35 (45w on 2m and 35w on 70cm) dual band amplifier for $110. The amplifier has auto switching between the two bands. For 6m I am screwing around with modifying a cheap, junk box special, wide band ex-CB radio linear for a friend to use with his 6m transverter kit he is building.

Homebrewing can be a lot of fun, if that is your goal. But, if all you want is to get on the air quickly, and cheaply, checking out a few local ham swaps for used amplifiers may be a better way to go. Of course if the one you buy for a REAL bargain price because it don't work, then you still have the fun of opening it up to "tinker" with the insides to fix it. That can be almost as much fun as building the thing from scratch depending on what is wrong with it!

Hi Louis,

I had the same problem that you have, I live in an apartment (ground floor) and my land lord didn't want me to run an "unsightly" antenna. Well, the apartment building is white so I went down to Radio Shack and got a roll of 32 gauge, white, wire wrap wire and late at night I strung a 40m dipole around the side of the apartment. I don't expect it is the best solution but it works far better than the indoor one I was trying to use.

Twice a week my landlord comes by to mow the lawn and passes within inches of the antenna but has yet to comment on it. I don't know it is because he hasn't seen it yet or just decided to ignore it since it can't be seen once you get a few feet away.

I've been to your page several times and I really like it. Lots of good projects. I have built your 80 meter VXO TX and I'm doing some mods and tuning it at present.

I must, however, be one of the 1% of the people who operate a rock bound on a regular bases. The transmitter I built for my use is a 50 watt output 1625 based 80m and 40m TX. I've used it for over a year now and have no plans to retire it.

They are definitely NOT right! I built my own transmitter before I got my novice license (Ok so I didn't get it working until after I got my license, with a lot of help from the guys on this NG) works great and cost me very little.

My receiver gave me some trouble but I finally got it going as well. My advice is to find a good transmitter and receiver, there are hundreds of designs on the web alone not to mentions many more in magazines at your local library, and build 'em. You may have to barrow a receiver from some kind sole to help you get a line on what should be going on but don't let those guys fool you. It can be done if you are willing to learn.

I don't remember things very well from 50 years ago, but I don't
think alkaline cells were particularly common 'way back then.

But if you mean "normal carbon-zinc cells", then YES, they can be
recharged. The best recharger I've ever made used alternating current
with about 90% forward and 10% reverse current. The idea was to give
them a "slug" of charging current and then a little bit of discharging
current (to dispose of excess gas?). My version of this charger used
a couple of diodes and two light bulbs; one small (10-25 watts) and
one large (up to 100 watts, depending on how much forward current was
desired). The bulbs act as both dropping resistors and pilot lamps!

Anyone out there have any pinout data on what looks like a ubiquitious 28 pin skinny dip chip used in a lot of the 486 boards for external cache systems. Very few of the current mfgrs of this type of ram build DIP packaged anything anymore. But these chips look like they would do quite well in ham microcontroller applications needing fairly fast ram such as the growing list of 8052 core controllers....Tnx for the read

Bob, KE6F

PS. There are lots of numbers on these things, but none seem to be carried across brands. Cyprus CY7C185-25, Toshiba TC55328-25, and Micron 24 pin skinny dip, 5C6405-15

I didn't think that alkaline cells existed 50 years ago.

This sounds a lot like the fellow who posted a question a few months
ago about some digital logic chips that were so old that they must be
pre WWII. I still smile when I think about that....

Hi,
I have a friend who operates CB (Yes he's actually a 4 watt legal CBer) who has this problem.

When going down the road he can talk and receive fine if the other party is in front of him. But once the car going the other way passes him, about a half mile and his reception is gone. He has no rear reception. He's running a K-40 mag mount on top of the cab (in the center) of his pick up.

Thanks for you help in advance,
Bill

Let me add one recommendation. Get a copy of "Solid State Design For the Radio Amateur" by Doug DeMaw and Wes Hayward. I believe it's still available from the ARRL.

A good example of what I was talking about is the computer industry. Most
add-on hardware vendors hate having to write the OS drivers to go along with
their product. Some in fact even contract out the work to write the
software. I have seen some drivers that changed on an almost monthly basis
to add features while fixing older bugs!

> > > This server object could at some point be moved directly

> CORBA is distributed, it allows for client and server objects could
> live on the radio itself.

I don't think the radio is a good place for the software IMHO. The manufactures can barely get the embedded firmware right to control the rigs various subsystems. Remember ANY mistake may require the ROM's to be replaced. Sure they could use EEPROM's and so on, but then the hardware costs go up.

The one question is what happens when the standards change? This can happen when new features are required for example, or we find that the so called standard is not so standard requiring a more explicit description of what each function/interface is required to do.

Finally computer power increases it seems at a faster pace that advances in communication technology. Keeping the software functions on a cheap desktop PC, with a low level interface to the rig, allows one to take advantage of faster computer hardware without the need to replace to whole radio.

> their
> wears.

That maybe nice for the vendors, but it does nothing for the little guy who wants to take a shot at doing some software. The beauty of open source code

is it can serve to educate at the same time it lets the Ham community find bugs faster than the vendor may do it. Plus at some point the vendor will drop support for "last year's" version and will only support the new one. I can't tell you how many dollars I have spent to upgrade software because of discontinued vendor support, of the older version, in the hope that the major bugs found last time around are fixed. In many cases I don't need the extra features, which my hardware may not support anyway, but I sure needed the bugs fixed! I can see this happening with SDR software. The old version may do everything a Ham needs, but the bugs make it less than useful. If the software was open source at least somebody has a shot at trying to fix it themselves.

" It's quarter to three,...." Hey, I love Sinatra with no
apologies (which is just how Frank would've liked it).

I think I'm falling in line more or less with your advice.
My current reciever is a RS DX-392 with which I'm pretty satisfied.
I'm sure by the time I get smart enough to know what's wrong with it
I'll have something better. Also, as I mentioned earlier, I'm going to
my 1st hamfest this coming weekend. I plan to get my first ticket. I also
may cop out and quit trying to learning Morse at 10WPM and just
accelerate by getting a cert. for 5WPM. A grevious sin to many of you,
I'm sure. Anyway, then I'd hope there'd be a kit dealer so I could pick
up a transmitter (probably QRP) so I could get on the air. Tubes are a
little scary to me as I don't know how to build power supplies, haven't
built anything yet! <grin>. Money is very tight: Fall back position is to
pick up a boatanchor on the cheap or upgrade my woeful antenna.
Test equip. SWR meter, ladder line etc. Can I expect kit dealers to
maybe be there? QRP is not so bad to me because right now I enjoy
sitting out on my open carport at nite to do my SWL'ing. Something
small, easy setup would suit me right now. Could I use the DX-392
as my receiver while transmitting or do I need to buy/build something?
For starters, of course.

Andrew

Did you have to neutralize the tube in the cathode driven - tetrode configuration? I was thinking of building an amp around one or two 813's (I have 5 of them in my junk box). I came up with a power supply design that will deliver about 2400v for the plates and 800v for the screens (about right for AB2 operation). This supply would have a voltage doubler in series with a half wave rectifer (giving a voltage tripler). The tap between the two supplies the screen. The screen and grid would be rf grounded, the filament feed by an rf choke and driven. I'm guessing that it would take less than 20W drive for full output (two bottles could deliver as much as 600-700w out). Wonder how yours worked. The only problem with the 813 is its outragous output capacitance. Even one tube single ended ends up with a very high Q tank (hi c to l ratio) on 15-10meters. With two bottles you have to either go push-pull or use some exotic tank circuit. Two ideas come to mind, no plate tuning cap and use a roller inductor or variometer to tune, or use a series Pi tank. Come to think

of it there was an article in Ham Radio magazine many years ago on an 813 amp using a series pi, and in CQ on an amp using 3 813's in parallel with some exotic form of L-PI network (using strip line for the L).

> Brian VE7IJQ

I once needed a regulated negative supply of -1.4 volts but did not have a negative adjustable regulator. So I took a 7905 (negative 5 volt regulator) and connected the ground terminal to the wiper of a 1k pot. The pots 'ends' went to gnd and +5volts. So I was using a bit of positive voltage to 'buck' out the negative voltage, and the regulator did go down to -1.4v. If you have a negative 5 volt supply you could do the same with a 7805 to buck it down to 2 volts out. Otherwise you are just better off with an LM117 series.

Hi folks,

I just bought a Heath SB-200 amp that's been sitting a while,
and I'm planning to rebuild the power supply. I recall that
many years ago there was a magazine article published in one
of the ham journals on rebuilding and upgrading the SB-200's
power supply. Does anyone have that information? I would
appreciate a copy, or at least knowing where to look. I'll
try the ARRL web site and see if there is a reference to it
(maybe it was a QST article).

I know for a fact that I purchased rechargeable alkaline cells and a charger just over 30 years ago from Mallory (pre-Duracell). I only purchased AA's, but the charger would handle AA, C or D sizes (4 cells, 2 at a time). The rechargeable cells did have slightly different markings than Mallory's standard alkalines. They weren't very popular, and I eventually just used the charger for NiCd's as they became easily available. The charger was just a wall transformer feeding a diode and series lamp with a different resistor added for each cell size. Does anyone have any archived info on these old cells? It would be an interesting comparison. They were purchased from Lafayette Radio, probably about 1969.

The "fringing flux" also does a really good job of heating the crap out of anything near the gap too, which includes the wire and the core material! The better material to use is powered iron. The gap is distributed over the whole volume of the core so any flux leakage from the core is low over the same volume. I had to design a DC choke for a high power Buck converter that stepped down from 650 VDC to a variable near 0 to 300 VDC at 67 Amps. The converter ran at 14KHz. Using ferrite the choke was a bust for the above reasons, but switching to powdered iron it worked just fine.

They, saturating cores, can cause gross current waveform distortion. The parent of the company I work for used this principle to build a magnetic frequency multiplier to go from 60Hz to 180Hz or higher for Induction Heating use. The DC control line, used to control the level of saturation in the core, which varied the amount of current waveform distortion. The output was then tuned to the desired harmonic of the line frequency.

1313. air spaced capacitor

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-01 00:00:00 UTC
From: Franki Van Neyghem <franki.van.neyghem@pandora.be>
Message-ID: <mpBh5.97061$_a.1910964@afrodite.telenet-ops.be>
Source record: 59026

I am currently building a magnetic loop antenna for HF. To tune the loop, I need an air spaced capacitor. I just assembled a kit, but I want to know what the points of connection are.
In other words: the loop is terminated on both ends by the capacitor, but what are the two points on the capacitor assembly on which I connect the loop? I guess it's on each of the 2 brass threaded rods you can see on the foreground, mounted on one of the two insluators.
Is this correct, and if not: where should I connect?

Thanks a lot in advance, 73's de ON1DRS

You can see a picture by clicking on the link:

Hi,
I have a friend who operates CB (Yes he's actually a 4 watt legal CBer) who has this problem.

When going down the road he can talk and receive fine if the other party is in front of him. But once the car going the other way passes him, about a half mile and his reception is gone. He has no rear reception. He's running a K-40 mag mount on top of the cab (in the center) of his pick up.

Thanks for you help in advance,
Bill

Two easy ways to get this:

Contact the ARRL Technical Information Service (tis@arrl.org).
They will provide a copy for a small charge (I think it is
$3 for members, $5 for non-members.)

Contact your local public library or school library. If they
don't have QST back that far, they can get it through the
interlibrary loan service. There may be a small charge for
photocopying and postage, or it may be free (my college does
not charge for this at all.)

Remember when there was not Internet, WWW, Windows, large hard drives, CD-ROMs, Ether net, etc? What is going to be next? Part of the answer is CORBA. CORBA or Common Object Request Broker Architectural is a distributed, heterogeneous, object oriented, language and OS independent environment. How is that for being buzzword compliant?

OK, how in the world does this relate to ham radio? Glad you ask. CORBA takes objects to the client/server modal. I have a ICOM IC-746 and I use Logger to log

My QSO logging program will read the current mode/frequency very nicely from the radio.

It will also track spots from the DxClusters, which it will tune my radio to at my request.

The problem is what if I want to control two radios from the same serial port? What if I want to have more than one program controlling the radio? What if radio is connected to a different computer with a different OS? The quick answer is I am out of luck!

Now with CORBA you can put a radio control server object on the system that has the radio connected to the computer, then have the client object send request to the server object. Since it is a server it can handle request from any different clients. Also since the client doesn't need to know anything about the radio and how to control it one client can control many different types of radios. Authors of logging programs need only write one interface. Radio vendors could/should write the server object. This server object could at some point be moved directly into the radio, along with many other server objects. This is known as SDR (Software Defined Radio). The non amateur world has already created a forum to create standards for SDR. You can join the group for a only $1800.00 per year.

They claim that this is going to be an open group, but there aren't any amateur radio member companies yet. Even the ARRL isn't a member.

Because of lack of amateur support and the need, I am starting a open source, open standard group to create standards and applications for SDAR (Software Define Amateur Radio). All code will fall under either the GNU Public Licenses or GNU Lesser General Public License, which is for libraries so that application authors can use the code without being required to release their source code.

I hope it is also clear that radio control isn't the only part of radio that will benefit from using CORBA. Rotor control, call book interfaces,

digital interface, DSP and much more can and will use CORBA.

Please join me to create a useful and free standard for Software Defined Amateur Radio (SDAR). Bring back the homebrew to ham radio!

Anyone interested in a pair of 220 MHz crystals for a Hamtronics R100 receiver and TA-51 exciter ?
I suppose they could be used in other RX and TX using the same IF and multiplication schemes.

TX = 222.520 MHz 18.57667 MHz fundamental using F/18
RX = 224.520 MHz 17.81833 MHz fundamental using (F - 10.7)/12
(Standard 1.6 MHz repeater offset.)

$15 for the pair.
e-mail me if interested.

There already has been a call for a common API to interface different
software, such as logging, and rig control applications to different radio
equipment. The idea is to write to the API, application programming
interface, for all functions. Then the API would call a small "device
driver" which does the detailed communications to the rig. Using this
approach "generic" software can be written to operate with almost any
equipment out there that does not need to control any model specific
functions of the hardware.

The non amateur world has already created

If it is done under the GNU public license I believe the FULL source code
MUST be made available to everyone who wants it.

The the two nodes of the capacitor are formed by the stationary plates and the rotating plates. One of the brass threaded rods should be electrically connected to the stationary plates and the other brass threaded rod should be connected to the rotating plate.

As the plates mesh together, you increase the surface area that forms the capacitor which increases the capacitance (see the equation for a parallel plate capacitor to see what I mean).

I'd guess the two brass threaded rods you mention are connected
together by the capacitor stator plates. The capacitance you want is
between the rotor plates and the stator plates. So one connection of
the loop would go to one (or both) threaded rods, and the other would go
to the connection to the rotor plates, which it appears are simply the
end plates on the cap, which the shaft goes through. Normally, if one
side of the capacitor is nominally "grounded," that would be the side to
connect to the rotor, so that there isn't a high voltage (to ground)
from the capacitor adjustment point (the shaft). But if there is a high
voltage from rotor to "ground," be careful about providing insulation
between you and the cap when you adjust it.

>
>The design was by G3PDM. That might help you to locate details, or
>maybe even the author.

The single conversion receiver design by G3PDM appears in the RSGB's Radio Communication Handbook, 4th edition, 1968, pp 10.104 - 10.108 plus insert between 10.106 and 10.107.

It is discussed in more detail in the RSGB's Radio Communication Handbook, 5th edition, 1976, pp 4.50 - 4.57, as a design study. Even then it was note that some of the original components (probably coils from Electroniques) were no longer available.

The synthsiser was a mixing type, mixing the output of the VCO (band switched) with a crystal contolled oscillator (band switched) to feed a phase detector. The other input to the phase detector was a VFO running from 5.88-6.38 MHz. Essentially it was a tube design with transistors for the dc amplifier and sweep generator, and germanium diodes in the phase detector.

Jim,

Thanks for your reply.
This is what I initially thought, as this is the only way to have two galvanic separated points of connection, and the only way to have a capacitive coupling between the stator and the rotor. Otherwise, you create an ohmic short-circuit, and this would not match the theory of a capacitor on DC...

The reason for me to follow the other theory was having talked about it with some other people, who tried to convince me otherwise, and I started to believe them in stead of following my "hunch"...

If you have any comments or advice regarding to the use of this kind of capacitor, please do not hesitate to cantact me.
Kind Regards, Franki

Not at all. Creating a common API be it CORBA or otherwise would be
an important port of making the radio a complete package.

>

That is only part of the idea of SDR and CORBA. Even with a common
API a lot is lost, such as support to distributed applications, sharing
of the API between applications and language/OS independents. Because
CORBA is distributed, it allows for client and server objects could
live on the radio itself. So it would be possible for the radio to
call complex routes on the desktop computer or other hardware systems.

Yes and no. GPL requires full source release, but LGPL does not at
least
of applications created from it. That is why I like it. We can keep
the API open and free, but it won't hurt the vendors who charge for
their
wears.

Thanks for you comments, often I don't explain myself well enough and
having
people ask me questions keeps me honest.

Andrew,

I've got a little story I think you should know... (sorry, couldn't resist!)

Congrats on wanting to build some gear -- you'll get plenty of help from this group. Here's what I would recommend to a newcomer with some money to spend (I realize you may be short there):

1) Buy a decent used receiver to get you started. Even if you choose to build a receiver later (and I recommend that you do) you'll have a backup receiver to use between projects, as well as a useful piece of test gear.

2) Build yourself a transmitter. This can be transistorized (but you'll pretty much be limited to QRP power levels), or it can use tubes at just about any power level you choose. Tubes are cheap (you can build an entire station using tubes that cost a buck or less apiece) and forgiving, but they do use high voltages, which can be dangerous as well as requiring a power supply other than the ubiquitous 12VDC that we all have sitting around.

3) At some point try your hand at building a receiver. We on the glowbugs (vacuum tubes) email list like to build regens, superhet/regens (supergainers) and "regular" superhets. The semiconductor crowd is building regens, direct conversion rigs and superhets. If your first tries don't cut it you've always got your backup commercial receiver to keep you going until you get your homebrew receiver right. There is certainly a magic to using all homebrew gear that the plug-and-play crowd will never know...

73,
Mike, KK6GM

1330. Ubolts and Saddles

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-01 00:00:00 UTC
From: Curtis Blevins <blevins@cdr.wisc.edu>
Message-ID: <39871F99.3FAA77C6@arrl.net>
Source record: 59043

Does anyone know where to obtain SS Ubolts and matching saddles. Allen Harbach is ill at the present time so they are not available from him at the present time.

Thanks

1331. WTD: 0.5 - 2Watt Resistors

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-01 00:00:00 UTC
From: DUNCAN WALTERS <tesla@cwcom.net>
Message-ID: <39873281.D838864@cwcom.net>
Source record: 59044

Has anyone a collection of 0.5 Watt to 2 Watt carbon film
or metal film resistors they no longer need?
I build valve (tube) circuitry and need resistors of this power range.
I am looking for quantities of as many values as possible.
A full set of E12 values would be nice.
Can anyone help?
Please reply soon.
Willing to pay.
Duncan G4DFV

Big difference here...I'm talking about using the good old SCR for power
control where they worked very well and with little distortion.

>
> They, saturating cores, can cause gross current waveform distortion. The

The operative word being "can", not will.
They can be used in either mode.
But much depends on design and bias.

You can make one go non linear, and you can design and operate one in a
relatively linear fashion. Depends on your goals.

We used them in near mega watt ranges, but eventually we went to water
colled Solid state SCRs. Two the size of hockey pucks could control as much
power as some very heavy Saturable core reactors.

Sure were spectacular though when they'd develop a spike and take out a
Varistor of 40,000 plus jouls.

Hi Franki,

Be carefull with using rotor contacts in magnetic loops. Besides the high voltage across the plates there are flowing high rf currents which could couse arcing. Better is to use a split stator or butterfly capacitor. I'm using a magnetic loop myself and i can tell you that these antenna's work great ! Look at http://www.iri.tudelft.nl/~geurink/magnloop.htm for details.
Some great hv capacitor ideas can be found at the homepage of Tony ON4CEQ. The address is http://www.qsl.net/mnqrp/Loop/index.html

Loosen up on the coupling. Wonder if you're trying to direct couple maybe? Try the counter with an antenna at a minimum distance that you can still pick up - IF you have access to a broadband amplifier of some sort (even cheapo TV one) you might use that between the pickup and your counter input to further loosen coupling and still maintain good sig.

best of luck

> The operative word being "can", not will.
> They can be used in either mode.
> But much depends on design and bias.

When you talk about "saturating" the core you are implying operation over
the VERY non-linear section of the core's B-H curve. To vary the inductance,
of a coil lets say, you have to vary the mu of the core material. Operation
over the linear section of the B-H curve implies a nearly constant core mu,
i.e. no variation in inductance for a coil wound on the core. When the core
is operated in the non-linear section of the B-H curve, the core mu drops,
remember mu=B/H, so the coil inductance drops as well.

Now if you try to couple energy between to windings you will get high levels
of current distortion. The H-field is generated by the ampere-turns of the
coil being fed current, and the current out of the second coil is depended
on the B-field. You can see the current distortion by simply plotting a
sinewave, in terms of ampere-turns, on the H-field axes, then reading off
the corresponding B-field value. What you will find is the B-field plot will
not look like a sinewave at high levels of core saturation.

> You can make one go non linear, and you can design and operate one in a
> relatively linear fashion. Depends on your goals.

Correct. You are either operating a given magnetic material in its linear region of the material's B-H curve, or you are operating in its saturation region.

> We used them in near mega watt ranges, but eventually we went to water
> colled Solid state SCRs. Two the size of hockey pucks could control as much

What did you do to clean up the problem with line voltage notching caused by the SCR power controller? About the only common solutions I have seen so far are, connecting the SCR controller to a transformer with a fair amount of impedance, or using line reactors.

> Sure were spectacular though when they'd develop a spike and take out a
> Varistor of 40,000 plus jouls.

I like it when the 480VAC cables jump like a live snake from the fault current when a SCR fails shorted! If you can't see the cables jump, you sure can hear it in the conduit or cable duct when they bang around.

>For starters, of course.

Andrew,

When I got my first licence in 1954, I was about as broke as you could get. At that time, I got on the air for about $5.00, and had a lot of fun doing it. My local Elmer gave me a surplus ARC-5 receiver, and a crystal in the 40m novice band. I built a transmitter with a 5Y3 and a 6V6, salvaged from an old radio. With this setup, I worked 27 states from W6 land during my stint as a novice. (At that time, the novice licence was only good for a year.)

To me, part of the joy of the hobby was doing the best you could with whatever you had. I continued to build all my own transmitters, up through the mid 60's when I abandoned the hobby for 38 years. Now I'm back, and I find my interests are still the same, though I probably do more restoration of old tube gear than scratch building.

Amateur Radio is still a wonderful hobby, with room for all sorts of people with all sorts of interests. Ignore anyone who tells you, "Forget it."

Try loose coupling your counter to the GDO using a sigle turn link placed at
the
base of the plug-in coil in use, away from the main winding.
Connect a lead from the link to your counter then use the GDO in the normal
way.
This should not cause any frequency shift.
Best wishes,
Duncan G4DFV

Well for starters I think you are trying to be too precise. When you use the GDO the frequency will shift because of the coupling to the circuit under test.

Otherwise use the loosest coupling possible to get a reading and settle for that.

(Correction to TX crystal frequency from my previous post)

Anyone interested in a pair of 220 MHz crystals for a Hamtronics R100
receiver and TA-51 exciter ?
I suppose they could be used in other RX and TX using the same IF and
multiplication schemes.

TX = 222.920 MHz 12.384444 MHz fundamental using F/18
RX = 224.520 MHz 17.81833 MHz fundamental using (F - 10.7)/12
(Standard 1.6 MHz repeater offset.)

$15 for the pair.
e-mail me if interested.

I have 1 of the type M68729 class C (i.e. FM) 30 Watts out average, 40 Watts max. These will replace older M57774 modual just fine. The input drive is 300 mW for 30 watts out. I am asking $50.00 including shipping to conus for them. RF parts wants around $70.00 for the same.

These are brand new never been used and still have the one inch leads on them.

Thank You,

Bryan Fields, KB9MCI

The way a GDO is made makes it shift frequency very easy. If you have a counter couple it as loose as you can to get a frequency readout, then witht he counter in place use the GDO as you normally would. Even when you vary the coupling from the GDO to a tuned circuit the frequency of the GDO will change somewhat. You are changing the capacitance of a tuned circuit.

hi -
I would be interested in hearing from individuals who are using a VLF receiver to receive WWVB from the Tampa Florida area. My interest is in comparing notes regarding reception quality. We're using an HP-117A VLF receiver with an external xtal filter/amp and homebrew ferrite loop antenna. Please e-mail me direct. Thanks..

Greetings all!

Last weekend I was given an old (and I do mean -old-) 6-meter "squalo." I believe it was made by Cushcraft back in the early 1960's, maybe late 1950's.

It appears to be "compleat." Well, using the M2 6-meter loop as an example, there may have been a support running from the center of the loop to near the feed point. I need an builder's guide/ operating instructions to be certain. Cushcraft didn't have it. Neither W7FG nor Sarrio had it.

Anybody got one? I'll graciously repay the person for the xeroxing and the mailing.

Thanks in advance.

In an indirect way this is already happening to some ham gear. My Kenwood TS870 HF rig can be remotely controlled by using an RS232 serial port. The rig itself should (without breakdowns) be useful for 20 or 30 years (judging from useful boatanchor gear around today). However the RS232 serial port will likely be history in just a few more years. And the operating system to run the 16 bit control software won't be far behind. I guess I should save a contemporary software/computer system just for the rig...

Good reason not to stick everything in one box with a closed design. At least with computers you can upgrade them to an extent by swapping out cards, drives etc. What would be neat is a rig where you can swap out modules, such as the front end, bands, PA's etc. All you would need then is an "empty" box, with a dot matrix display front panel using soft-keys, where you just drop in the modules for the functions you want. I know this has been done to an extent before, FT-726/736 for example, but the modules were BIG and COSTLY! After ten years of advancement in electronics, and DSP, I think its time to take another look at this idea.

Looking to replace a 5 pole tank switch in an old transmitter.
Origional switch is about 4 inches in diameter , 5 pole or more and MUST have 12 positions
to match another "toothed belt linked "switch for the input circuits.
This one also has a ceramic shaft to the switch commons so it would seem to be a very high voltage switch.
Shaft size is standard 1/4 inch but I could easily cobble adapters as needed.

No.

I had more problems getting on the air... blowing up electrolytic caps
all over the kitchen, finally getting on the air on 40 meters and having
my first contact be a guy three miles away complaining of my 20-over-9
harmonics on 20M, and so on. But I learned one hell of a lot. And if
that sounds scary, remember I had no elmer, no Internet, no one around
me who knew a capacitor from a cadaver; you're likely to have much less
trouble but get the same knowledge and enjoyment.

There is no satisfaction like turning on the power on your own handmade
equipment and watching it do what you made it to do. Even kits are great
for that, but nothing near as satisfying as a "scratch" project.

Warning: it's addictive.

I'd also suggest you try one or several designs of a magnetic loop antenna. They are high-Q, and do develop high voltage at the "top", but they certainly do radiate and require no ground (or image) plane. I still have one I built for 40, 30, 20, and 17 meters, yes, all in one antenna tuned at the top with about 200 pf (max) of variable capacitance (3 kv spacing for 50 watts). It has the added advantage of a couple of very deep nulls and is only about 4-feet in diameter with a 10-inch diameter "feed" loop. Mine was made of 1/2" copper tubing with the feed loop made of #8 AWG copper wire (could also use smaller copper tubing for easier bending). Hang it from the ceiling for easy rotation.

Just a thought.

At their best any GDO calibration (readout) is sorta close, do not expect great accuracy, it is just designed to get you in the ball park. I have two, one of which is a Millen, and neither are very accurate, but close enough to do the job. Even if you could calibrate it for one frequency with each coil, the bandspread linearity would still be poor. "It is however an indispensable tool".

It is true that GNU had it's root in Unix, but many GNU applications
have been
ported to WinTel such as GCC, emacs, vim, bash, etc.

But the idea isn't to be Unix based, Window Based, MAC based or VMS
based but
CORBA based. CORBA isn't tied to any one OS, architector, language or
machine.
CORBA routes object request via an ORB (Object Resource Broker) which
talks
to another ORB which does the work and returns the results.

Keep in mind that is just an example.
Just for example lets create a CORBA environment using todays equipment:

This CORBA ham shack has:

Computer 1: Win98 P1 with two rs232 port connect HF radio and rotor.
computer 2: P2 Linux system also with one rs232 port connect to TNC on
2m packet
DXcluster
computer 3: Win2K with great monitor and graphics also with rs232 PTT
for PSK-31
computer 4: Mac with great sound processing
computer 5: Call Book Central service (CBC) located on the Internet
computer 6: DigiQSL Card server.

All computers connected via ethernet.

ORB connection:

The control workstations (computer 3) is the Win2K which is running
OrbLog 1.0
which connect via ORBs to:

computer 1: HF radio and rotor to set/read freq/mode
computer 2: to the DXCluster to locate spots
computer 4: copies audio from the radio to the Mac where the Mac does
AF DSP
before outputting the signal to the speakers.
computer 5: to CBC Callbook Database to lookup call signs info.
computer 6: DigiQSL to send out either digital or hard copy QSL cards
once the
QSO is completed.

Impressed? Wait there is more. Using naming services, it is Plug and
Play. You move
your rotor to a different system. OrbLog finds. Move the radio to a
Linux system.
OrbLog finds it.

Buy a new radio of a totally different brand that just came out, OrbLog
doesn't care,
the ORBs takes care of those details.

This is all stuff that can be done by us, without help from radio
vendors. When
the vendors start to see the light, they will start putting ORBs in
their radios,
then magic is really going to start to happen. Notice that I said when,
not if.
CORBA is like the Internet was a few years back. Those who understand
it know
that CORBA or something like it is going to be an important part of just
about
every computer.

I am exited because once this takes hold we won't have to work about if
our
logging program will talk to radios, DXclusters, rotors, etc. It either
will or we can write a CORBA ORB without changing the app. It is going
to rock!

: Geez.

Do you know of a browser that cares? Even Lynx does not care.
Actually, the preferred specification starts with "URL"

From "A Guide to URL's":

Now, when presenting this URL to people, there is a general syntax that ought to be used to avoid
confusion. Many people place the URL on its own line, separated
from text below and above by whitespace. Most people consider this sufficient. However, a more
precise syntax is recommended by RFC 1738, and distinguishes URLs
from other Uniform Resource Identifiers (URIs). (URLs are a subset of URIs.) This syntax is to
preface the URL by "<URL:" and terminate it with ">". Thus, when
sending the above URL to obtain Netscape for Mac via email, I use the syntax:

<URL:ftp://ftp.mcom.com/netscape/mac/netscape.sea.hqx>

Other recommendations exist, but this is the format used within this document and the RFC which
defines URLs.

You can read the whole text at:
www.netspace.org/users/dwb/url-guide.html

Good luck finding the National RC transmitter receiver pair. They quit manufacturing them some years back. I have yet to find a supply of them in small quantity

Regeneration in detectors is controlled by feeding back rf signal
in the proper phase, inductively, or capacitively back to the front
end of the detector from the output of the detector, to induce oscillation.

Typically, if a resistor controlled voltage is used to effect regeneration,
the inductive and/or capacitive values are fixed.

IFF, you have insufficient regeneration control, it would suggest that your
control voltage is too low (bad pot, improper resistor value, or something
like that in the voltage control line) to effect oscillation. One other
cause could be tool few turns on an inductive feedback coil, or a bypass
capacitor (used to pass the signal back to the front end of the detector)
has too low a capacity (possibly due to manufacturing tolerances or maybe
you used the wrong value capacitor inadvertently).

Often, just a few pf of extra feedback capacity, or one extra turn of
inductance, is all that is required to make the difference. The higher
in frequency, the less effective is the regeneration, and more feedback
is required. That little extra bit can make or break it on higher
frequencies.

One other point to check is the bandswitch, if used (I am assuming it has
one). Sometimes one wire off on the bandswitch will kill one or more
bands. It could be something as simple as that.

Solder joints are not usually a problem at HF in receivers, but, they
could be. Hitting all joints a second time with the iron might find
a cold or high resistance joint. That could be important in detector
circuits, or in power lines in a receiver operated at low voltages.

The antenna should not have any great effect on a good regen design. IFF it does, that is a sign it is too highly coupled, and that can kill off regeneration considerably. If the set oscillates on all bands with no antenna connected, and then dies on some bands, then it is way overcoupled, at least on the affected bands.

The secret of running a regenerator is to use the loosest coupling possible, and let the set provide the gain behind the detector.

Good Luck

1386. Happy Flier's VHF Radio Direction Finder???????

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-03 00:00:00 UTC
From: nuckolls@aeroelectric.com
Message-ID: <3989015c.20469405@news.supernews.com>
Source record: 58940

About 20 years ago, a group of techno-wienies in the CAP developed an antenna switch and demodulator system that was easily adapted to VHF AM communciations receivers in aircraft. By comparing the phase angle of a received signal to antennas on each wing, the demodulator would drive a zero-center meter movement to provide a pilot with left-right steering information to home in on a VHF carrier within the tuning range of his receiver.

This circuit was used with some success to locate downed aircraft emergency locator beacons on 121.5 MHz. I believe the folk who developed and sold the kits called themselves "Happy Fliers". The amateur radio community purchased kits of parts to build portable units that were adapted to handi-talkies for hidden transmitter hunts.

I have a more modern application . . . I'd like to track animals in the wild that have been fitted with radio collars. Does anyone out there have any information about this or a similar adaptation to a receiver to acomplish the same thing?

As I recall, the circuit used an oscillator to drive a single-pole, two-position pin-diode switch to alternately supply the receiver with the signal of interest. The oscillator ran at several hundred hertz.

A sample of the receiver's last IF was detected and worked on by a demodulator driven by the same oscillator. The resulting DC output was analogous to the relative bearing of a received signal in front of the aircraft.

If anyone has documentation on this system I'd sincerely appreciate getting some feedback on it.

Source record: 58941

To all fans that have built and used the Ten Tec 1253 regenerative receiver kit - PLEASE HELP.

I completed building my kit two days ago. The radio worked fine since the very first minute except for one thing. I can not get it to oscillate on any of the upper three bands. Apparently, the regeneration control works fine on bands 1-6, but on bands 7, 8 and 9 I simply can not get the radio to oscillate, even with the regeneration control all the way up. I tried to adjust the R6 pot following the instructions manual, but without success. Actually the R6 pot seems to have little influence on the "sensitivity" of the regeneration control - in order to make the radio oscillate I need to turn the regen. control up 80-90% on all bands.

What am I doing wrong? I checked the circuit board for any "cold" welds or bridges but found nothing. Would a good ground connection and a large external antenna help (make the radio oscillate at lower regen. control settings)? Currently I am using a 30ft random wire connected to the radio via a balun and a 30ft coax. cable. This antenna works very well with my other receivers.

I will appreciate any help / input / tips on the subject.

Regards.

> How can I simply calibrate my GDO ? I have no communication receiver
and
> when I connect my counter to osc, the frequency shifts..

As others have said, don't expect the GDO to be very accurate anyway.
But here are a couple suggestions:

1. Couple the counter to the GDO at the same time as you're using it to
"dip" your circuits; then you can read out the frequency at that time.
You could modify the GDO to have a (buffered) output spiggot that goes
right to the counter. With a little buffer amp in the GDO, the counter
also would no longer pull the GDO significantly, and you could run your
cal.

2. Make a simple "receiver": make an xtal osc at, say, 1MHz or 5MHz,
and use a simple digital-IC circuit to generate narrow pulses at that
rate. Feed them and a little antenna or pickup loop (sampling the GDO)
to a mixer (could even be just a diode), and feed the mixer output
through a simple audio amp to a speaker or headphones. You'll hear the
GDO as you tune it up through each harmonic of the osc freq. But as you
get to higher freqs, it will be VERY hard to tune the GDO slowly enough
that you don't miss the "chirp" as you tune through.

If the act of making a measurement shifts the GDO frequency,
just listen to it with a radio receiver which has a digital
frequency readout.

These modern hand-held digital antenna analysers are much
better at the job.

I built up a 6AG7 driving a pair of 6L6s. Worked quite well.
I did have a good receiver though...A Hallicrafters S40B with a Heathkit
Q-multiplier. <G> You just had to keep one hand on the tunning know so
keep up with the signals.

Not true, unless you are running version 1.0. Maybe I am missing something here, but every version of Netscape since at least 3.0 will assume the http:// prefix if none is given.

:

I have been thinking about this thread since it started. The value of a ham API for radio hardware is great. Some manufacturers will follow right away, others will remain proprietary until hams start expecting/demanding a compatible interface. The idea of using CORBA at the equipment level is bad. CORBA is too heavy for this class of imbedded application. The processing load is sufficient in many radios to force the manufacturer out of using a lower-cost processor. Compare Gnome, a CORBA-based windows manager, to KDE. KDE performace is much better because of the CORBA overhead. Note that KDE is slowing moving towards a CORBA standard, but that move has happened only after the "economy" PC moved past the 500 MHz speed mark.

The value of an object-oriented and network-centric API layer above the equipment layer makes more sense. Look at the OSI or other network layering and you will see that the ethernet card does not need to support a protocol as heavy as CORBA. Let the hardware have a common API, but put the object packaging above the equipment layer. If you want a unified CORBA solution, you can design a box to fit in between the radio and the network that supports CORBA or some other object model. With a common API, the box will always work. A well-designed box could have outputs for ethernet, tcp/ip packet, ppp, IR, wireless IP, or a proprietary scheme. This approach opens all the same doors, lets the manufacturers keep their 4-bit processors, saves the manufacturers from having to invest too much engineering time meeting the CORBA standard, and opens up a new market for the CORBA interface box.

I'm not familiar with that particular model but with most regens you may have to either add turns to the feedback coil or adjust the spacing between it and the main tank coil. Also, try reversing the winding of the feedback coil of the affected band. If the feedback phase isn't correct it will never oscillate. If all that doesn't help a quick call or email to Ten-Tec might yield other ideas. They are good about helping with problems on their equipment. 73.

Hi Andy and group,

You bring up a lot of good points. CORBA is quite a heavy has the press
has made it out to be. Of course anytime data marshaling and network
protocols are added to an apps things will slow down a little. One of
the
problems so have had with CORBA was they tried to do too much with
CORBA.
i.e.: "Let's make CORBA wrappers for all of our API". Never the less
your points is very well taken. I could also be wrong about this and
CORBA is a total dog. At any rate, I like the concept behind CORBA
even if it isn't the finally solution.

I think I understand your interface box, but could be the same
system as the users PC. Which was how I was trying to lay out
the example. Each PC had a server ORB(s) to manage one aspect of the
station. As you say this solution would take us a long ways to
proprietary and driver independents without moving any intelligence
to the radio. This will come. My hope is that if we can form at
standards forum we can kept one vendor from trying to rule the world
and kept everything open.

Andy I like your attitude! It is refreshing to have someone not
only points out problems, but offer other solutions. Your comments
are most welcome!

Salvaged the power supply out of a broken computer and
noticed it provided 12v at 7.5 amps. Was wondering if it
could be used to power a 10 watt 2 meter rig. Are they
filtered/regulated enough?

Thanks,
Dave

> compatible interface

IMHO a common API which all Ham Radio software used to control hardware is the smart route to take. The equipment manufactures may not need to much, if anything, to support a standard common API. Most systems are designed in a layered approach anyway to isolate code modules, and systems from another. A layered approach lets each layer change internally without impacting the interface to the other modules above or below it. As a minimum the system would be the hardware level, the driver module level, and finally the application software level.

The manufactures of Ham Radio equipment may, or may not, need to add extra "commands" to their software interface to support a standard API. By allowing the manufactures to keep their current command set we will insure the rigs will continue to work with older software, while providing the extra functionality, transparently for old software, to support a Ham Radio Equipment interface standard API. Hardware which currently does not have any form of software control will need to have it added.

The driver module typically interfaces between the application software, and the Ham Radio hardware. The driver module can communicate directly with the hardware, or use another driver, for example to talk to a RS-232 port or a LAN card. In any case the driver is the place where the translation from the propriety equipment manufacture's command language, for rig control, to the standard API takes place. Even at this level it is not unreasonable to have a series of lower level drivers, one for each piece of hardware, interfacing to a high level driver, which "exports" the standard API. This is the system used by many operating systems so that additional hardware can be added, or changed, without the need to rewrite all the application software.

Finally the application software is written to the "exported" API, and NOTHING else. As long as the application programmer does not take short cuts by trying to communicate with the hardware directly, or at a level below the top level driver exporting the API, we can change the hardware at will. This is like a PC application where you can read and write a file to your ZIP drive, hard disk, or a network drive. For the application software the operation is the same because it is using the API provided by the operating

system, which works by hiding the hardware differences among the different devices from the application.

>and this was all too soon after losing Doug, W1FB...

I'll agree--Lew did a lot, especially for beginners in ham radio.
I once thought the same about Doug, but Doug, in my one (written)
contact with him, acted like an outright SOB!

(After reading a QST review of what I vaguely recall was a remote antenna
tuner, I wrote him to point out that he apparently either missed or
ignored the fact that remoting the two parts did NOT REQUIRE [as he
described it in his review] a separate cable, for the design included
enough capacitors and inductors for the control signals to also use
the RF coax path. He replied with a virulent/vitrolic/vituperative
letter to the effect that I obviously didn't have the slightest idea
how the thing worked, that my ham radio skills were obviously
deficient, and so on.

I always hoped he had just had a bad hair day before writing me, but
I never trusted his reviews after that.)

Hi Dave.
Some of these supplies require the 5 volt primary output be loaded to some minimum value so that the secondary outputs will work.
Hey ....try it.

It depends - some have minimum load requirements or they
go berserk. I once made and used a power supply test load
from some hefty resistors I bought at the local surplus
store. You may want to try something similar.

All switching power supplies generate noise, so they need
to be well shielded.

: Finally the application software is written to the "exported" API, and
: NOTHING else. As long as the application programmer does not take short cuts
: by trying to communicate with the hardware directly, or at a level below the
: top level driver exporting the API,

Ouch! You just hit on an important problem. I have been investigating the
problem of remote control of a radio through networks. Think about adjusting
a tuning knob on a receiver for listening to SSB. Now, imagine a delay
between the knob adjustment and what you hear. Tuning becomes a nightmare.
Internet control of a radio introduces these delays, mostly in network
delays and audio encoding delays. If a heavily layered series of
APIs and drivers add to that delay, then the problem only gets worse.
Too much layering, or an incomplete API can interfere with smooth remote
radio control even if the other problems (delays) in the system are
solved. Some method of issuing low-level commands might be a part of
the specification.

:we can change the hardware at will. This
: is like a PC application where you can read and write a file to your ZIP
: drive, hard disk, or a network drive. For the application software the
: operation is the same because it is using the API provided by the operating
: system, which works by hiding the hardware differences among the different
: devices from the application.

Leland and the group,

Everything you say is true, and a conventional API standard may indeed
be a good starting point. Conventional APIs have following
disadvanages:

1. Must live on the same system.
2. Must be loosely or tightly linked with the application
3. Language restrictions.

I am sure it has others but can't think of them now.

Of course CORBA isn't the end all either it has the follow disadvanages:

1. Limited Windows support so far. It is coming.
2. There is a small (less than 1 millsecond) performance hit,
which if handled correctly won't be an issue.
3. There is a learning curve.

I do think you are right in that we should start off with maybe a
DLL library or ActiveX.

I am going to take a first cut a radio interface spec this weekend
and post it to the project mailing list.

I've had good results by connecting 10 ohm/ 5 watt resistor from +5
volts to ground. It's used as a load.

Yup..plus they need to have all leads going from inside to outside of the power supply box to be bypassed to prevent external RF fields from affecting the switching frequency and driving the supply goofy.

Just junk it & build a 12v supply. If it doesn't blow up because of low load, the rfi will drive your radio equip & you nuts .

1421. I am Curious Vertical: Off-Topic Antenna Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-05 00:00:00 UTC
From: cathexis@erols.com
Message-ID: <398b5f25.259155436@news.erols.com>
Source record: 58796

Greetings,

I know this is a little off-topic for this ng.
I'm asking here because I get the best overall advice here.
My dumb question goes like this:

Suppose you had a ground-mounted vertical cut to "what-ever"
wavelength you planned to do your transmissions on. Okay. But
what if the vertical was primarily for *recieving*; In this case would
the-higher-the-better be true? Even if radials were limited to a more
reasonable horizontal lengths by yard dimensions.

In other words, my (somewhat idle) question is that when I finally get
my ticket a vertical may be a good idea for my backyard. But in the
meantime if height only improves receptivity (not assuming this, mind you),
than I've got an 80yr old Elm out back that could take some serious altitude
ala the bow and arrow trick. I've even been wondering if it might be possible
to turn something like this into a twin antenna; 1 very long for gen'l
multi-band scanning and the other cut more stringently for transmitting.
Is all this a pipe dream or have potential?

BTW, thx. for your patience as I know this should go to rec.radio.antenna.
Just don't know anyone over there.

Andrew

1425. Amplifying transmitter output

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-05 00:00:00 UTC
From: Oliver <rockets-nospam@attglobal.net>
Message-ID: <songuf1d4v21@corp.supernews.com>
Source record: 58800

I bought a small transmitter chip from radio shack that transmits on 434MHz (AM) at 8mW. I use it as a radio beacon to locate my model rockets. I just got my tech radio license. With that I could transmit with much more power. Is there an easy way to take the antenna output of that little transmitter and amplify it (let's say to 50-100mW)?

The range I currently get is about 3/4 to 1 mile (when the rocket is laying flat on the ground). What kind of range could I expect with e.g. 50mW?

Most scratch made transmitter designs I found require some kind of adjustments using a scope. I don't have a scope, just a Multimeter and a logicprobe. That's why I'd rather use this existing transmitter.

--
Thanks

Oliver

1427. Kenwood TR-9130

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-05 00:00:00 UTC
From: Franki Van Neyghem <franki.van.neyghem@pandora.be>
Message-ID: <t1Ti5.23467$5l3.413473@afrodite.telenet-ops.be>
Source record: 58802

I have a problem with my TR-9130 rig. It SEEMS that the microcontroller is continually resetting at start up, but the RF-circuitry is working fine. Symptoms: flashing LED-display when squelch is open, dim or unlit segments when squelch is closed...

What did I do so far?

1. I re-soldered most of the connections, but the through-platings are hard to do; the solder everytime "blows up" into a bulb... Nevertheless, this seemed to help a couple of days...

2. The problem turned up again... With the heat-gun and freeze-spray, I could create the problem, and make it disappear... Maybe leaking capacitors? I changed ALL electrolytic capacitors... Didn't help...

3. Some extra observations: in the beginning the problem went away after the TRX heated up (10-20 minutes). Now it doesn't even disappear anymore, and what's more: the vfo-dial to tune does not respond anymore.
Power supply on the input of the (series-)regulators seems ok (13.78V), but when the display is flashing (reset of µC???), the supply voltage to the µC itself is only 3.2V, where it should be 5.2V if the TRX is properly working...

Anyone had similar problems, and somebody knows what to do???

Thanks in advance, please mail me your experiences...

Message-ID: <3989EF13.7350@nbnet.nb.ca>
Source record: 58804

Howdy Andrew.....Only stupid question is the one never asked! My experience with verticals has been that they can be one of the most fickle types to have work well mostly because there are a lot of variables which work against you if space and proximity to other large objects (buildings/near field hills/large metallic structures) is poor. The ground plane is key to the "consistent" and "predictable" effectiveness of this type of antenna. This "ground plane" could be a minimal/non use of radials over superb conductivity - seawater/salt marsh etc, an extensive system (every few degrees) of buried radials cut nominally 1/4 wavelength at the lowest anticipated operating freq, a "ground screen" system of radials laid upon the surface of the ground (hard to plow 'em into permafrost or solid rock on a coast) OR an elevated ground plane of radials (I'm sure you've seen the minimal setup of 3 or 4 radials positioned at the base of elevated verticals). Why all this mention of the ground system....the vertical (GENERALLY a 1/4 wave**) requires this ground system as it's "other half" due to being fed "TYPICALLY" at the base of it. You can see there are other likely possibilities....I won't go into 'em here - I'd highly RECOMMEND any of the ARRL books on the subject (lots of other good ones out there also). The 1/4 wave vertical (typical setup) only exhibits a low impedance (easy to match with coax) and USEFUL / PREDICTABLE pattern when installed as described. So....will hoisting it up into a tree work for reception...yes - somewhat (so will sticking a random length wire directly into the jack on your receiver). Will it work better mounted correctly - yes - providing it can be installed in the clear and away from nearby structures/near field hills. Alternatives - For reasonable reception and later for transmission, why don't you try pulling up a nice high wire/insulated end into that oak tree...experiment with using a random length tuner at your shack end and try a simple ground with an 8ft (6ft etc) ground rod or WHATEVER you are willing to try...at first. You'll be amazed at how the tuner will PEAK your received signals and this will also give you some insight / feel for how to adjust it for transmitting...down the road. I started with a vertical - close to the house with no/poor ground and didn't understand or get the feel of it until much later when, as a commercial R/O and tech I had to repair/install these systems and then use 'em PREDICTABLY (big key here is that almost ANY sort of antenna can be used to make random / often unpredictable contacts).

NOTE ** I've talked about the 1/4 wave vertical as I'm guessing its what you might be looking at.....the use of a 1/2 wave vertical, fed at the center is indeed a vertical dipole which is "ground independant" (its a complete antenna) BUT which you'll soon see is a long old antenna at even high HF frequencies.....Good and often used however at VHF and

up. There are quite a few other wavelength arrangements, each with their own problems/features - read up if you're interested.

73 - Keep on Tinkering.......THAT.....is REAL HAM RADIO

Gord VE1AJF

1430. Re: 12 volt power supply from computer

Newsgroup: rec.radio.amateur.homebrew

Source record: 58805

Howdy Dave.....Have read the threads responding to your query with a lot of the same reservations that your help has had. Most (ALL?) of the responders have assumed the power supply you have there is a switching type - which have tempted us all at times and which are indeed used successfully by many people and some well known commercially marketed ham rigs. I did scrap some old commodore PET computers (Apple PETS?) a few years ago which had a fine LINEAR power supply in 'em and if this might be what you're looking at - fill your boots either as is or don't be afraid to use the basic transformer/rectifiers etc to build your own.

I can tell you from experience that those tempting switching power supplies from computers (old DEC 12volt 30 amp sections etc!) can be a chore to power up with a widely varying load as in the case of a transceiver which might only draw milliamps RX and many amps TX. The supply might not turn on even with light load and may overshoot or destroy itself if a good load is suddenly taken off it (these supplies were best used with a designed "window" of load current which was powered on or off by the input to the switching supply - not by turning on or off the load). Best of luck - let us know what you found out.

I have been using a switching supply with my dual band ht for 6
months now. I have not noticed any rfi but i do have to turn on
the radio before the supply to get the supply to power up, I
have not tried a resistor on the 5 v side but the load of the
radio is usually enough. I built it into a cabinet with a
communication speaker and put binding posts for the hook up.
The only thing I have noticed is that the voltage will not go
over 12 volts (maybe that will save my bulbs) but my dj-582 and
my at-600 both get 5 watts at this voltage so i am happy with it.
I have even put a 11-meter on it to veify it worked for my
neighbor and had good signal reports(if you can believe what
they are telling you).
The supplies are plentifull and free and the one I am using has
been loaded up to about 7 amps(and it still held 11.8 volts)
with no problem other than the fan speed increases.

Jarek

The best resource I know of for this sort of thing is the QRL-L archive at http://qrp.lehigh.edu/lists/qrp-l/ . This is a bit tough to search, so if you can get your hands on the QRP-L CD it's better. In Europe, Jon Iza (iapizloj@bi.ehu.es) has the CD for distribution. I don't know what the price will be over there - it's basically the media and postage.

But some of the common, popular answers:
- Seems like the Elecraft K2 is the best bar none. (http://www.elecraft.com/) Pretty expensive for a kit, but one of the best radios around - all band, SSB optional, Automatic tuner optional, built in keyer, etc., etc.
- Elecraft is soon to start shipping the K1, a 2 band version of the K2 for about a third the price
- The Red Hot Radio (http://www.redhotradio.com/) NC-20 is really dynamite, but they are shut down for the summer
- The next best is probably the Small Wonder Labs DSW series (http://www.smallwonderlabs.com/) - unavailable due to parts shortages
- Next down the list seems to be the analog Small Wonder kits.
- Morse Express has bought OHR (http://www.ohr.com/) and has their kits available, but they seem to be getting little press so I don't know how they compare to the others.
- Ten Tec has recently introduced the Cub, which is pretty low end. ARCI had a group buy, there may be some still available.
- Hands electronics (http://www.rf-kits.demon.co.uk/) in England has a number of kits. These tend to be a bit more technical - less polished - than the U.S. kits. Typically you get these as a series of modules which gives you more opportunity to add your own spin to the radio.
- You might also check Harry's Homebrew Homepage (http://hem.passagen.se/sm0vpo/). He has a number of kits, mostly modules, that you may want to assemble.

A lot of the kit makers, especially those with digital VFOs, are having parts problems, although even the ubiquitois NE602 seems to be getting hard to get.

For a lot of fun, but not a very good radio, Norcal's SMK-1 is very cheap (http://www.redhotradio.com/SMK_1.html). Norcal will be introducing a 10 meter radio later in the year that sounds very interesting. I plan on getting one as soon as they are available. Both these are surface mount. In fact, the whole point of the SMK-1 was to get people broken in on surface mount kits. It's basically a surface mount TT2/MRX so not the best rig in the world, but still a lot of fun.

Hope this helps

Low power amplifiers (say, under a couple of watts) are pretty simple business. Check the Radio Amateur's Handbook for a number of circuits and discussions of the issues. At 440, however, things are a bit nastier. At those frequencies, inductances and capacitances are very low, so layout and lead length become critical. This makes homebrewing for those frequencies a bit more challenging. Also, the transistors popular at HF typically offer no/negative gain at 440, so your parts selection becomes critical. On the upside, 900 MHz parts, which will work just fine at 440, are becoming very common.

However, there's another quirk. At VHF/UHF, propagation is strictly line of sight, so range really isn't affected by power. You still suffer from the inverse square law, of course, so going above 8mw is likely to help some, but more likely, simply raising your rocket a few feet off the ground would have a greater effect. (Of course, that doesn't help much with the problem of finding it!) Actually laying on the ground is tough because there probably are trees and such blocking the signal, but once you get above this inverse square deal, you should be able to get 5-10 miles. Increasing power beyond that won't help unless you get very high (hundreds of watts), and even that won't help much.

I suspect that with 8mw and some sort of (presumably) portable receiver, it is in fact the power at your receiving antenna dropping below the noise figure that limits your range. Increasing the transmitter power is a way to improve this situation, but remember your rocket now needs to carry the extra weight of the amplifier and the batteries to drive it. Another issue you need to address is spurious emissions. An 8mw transmitter can have a pretty dirty signal and still be legal. As you go up in power, you will amplify the garbage as well as the desired frequency. You will probably need to add some sort of output filtering to keep the signal legal. This isn't real hard, but it's additional weight.

It may be that a better approach is to work on the receiving end (although undoubtedly more expensive). A better receiving antenna and/or a receiving preamp could have as much or more effect as increasing transmitter power, depending on your current setup.

Keep in mind that increasing the power from 8mw to 50mw is only a factor of 6 - just a db or two. Going much above 50mw is going to add more battery weight and possibly heat sink weight. However, 20 to 40 db preamps are readily available, and getting 6 or 10 db's out of a 440 antenna isn't such a big deal either. This is the equivalent of going to around 10 watts, something that would require 5-10 pounds of batteries if done at the transmitter side. Of course, if you already have a hot receiver and a

really good antenna you might not be able to get those gains.

Hope this helps

almost 9db

8 to 16 mw =3db
16 to 32mw =3db
32 to 64mw =3db
total gain=9db, about 2 s units.

Going much above 50mw is going to add more battery

Good advice below but I have to add that a vertical can be a poor
receiving antenna because of noise pick up. This can be noticeable
during electrical storms when charged clouds go over. Even without
lightning the static discharge can be very high.

Otherwise a good transmitting antenna is a good receiving antenna.

Someone pointed me to this component:

http://www.minicircuits.com/dg00-132.pdf

I looking at MAN-1LN or MAN-1HLN. Would this work for my purpose? Which one of those 2 would be better? What is dBm? What kind of output in mW could I expect?

> business. Check the Radio Amateur's Handbook for a number of circuits and
> discussions of the issues.
I looked for that title on Amazon.com and found quite a few. Is there any particular author you can recommend? The books I found were published in 93. Are there any more current ones?

> but more likely, simply raising your rocket a few feet off the ground would
> have a greater effect.
I have already noticed that with the little transmitter I am using. As long as the rocket is off the ground (even just a few feet), I get a very strong signal. As soon as the rocket touches down, and lays flat on the ground (including the antenna) the signal drops drastically. (Maybe I should work on something, that will simply put the antenna straight up in the air after the rocket touches down - but that might be tricky ;-)

> of finding it!) Actually laying on the ground is tough because there
> probably are trees and such blocking the signal,
Actually, I am luck in that aspect, as I am flying at a Dry Lake Bed. No obstruction there! If the rocket floats past the dry lake bed, there are shrubs and uneven ground, which I am sure would adversely affect the range. I guess one way around that would be to raise the receiving antenna!?

> but once you get above this
> inverse square deal, you should be able to get 5-10 miles.
Inverse Square deal??? Can you elaborate?

> I suspect that with 8mw and some sort of (presumably) portable receiver, it
> is in fact the power at your receiving antenna dropping below the noise
> figure that limits your range.
I have already improved the range from going from a receiver with a 3uV sensitivity (600 ft range), to a receiver with a 0.6uV sensitivity (5000 ft range). I doubt I can do MUCH better than that on the receiver end. I guess elevating my receiving antenna (a 5 element yagi) could help.

> An 8mw transmitter can have a
> pretty dirty signal and still be legal.
Unfortunately I don't have any type of test equipment to test how "dirty"

this transmitter is. Would anything on the spec sheet indicate how clean this transmitter is? Modulation Bandwidth is -3 to 2 dBm (5kHz typical) - if this has anything to do with that.

> It may be that a better approach is to work on the receiving end (although
> undoubtedly more expensive). A better receiving antenna and/or a receiving
> preamp could have as much or more effect as increasing transmitter power,
> depending on your current setup.

Do you think I can boost the range any more on the receiver end, with what I gave you above? I do get about 5,000 ft now with 0.8mW. I was told, that this was already pretty good (especially considering the antenna is laying flat on the ground).

Thanks for your help.

Oliver

1445. Vote Nader

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-05 00:00:00 UTC

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

The message <398b5f25.259155436@news.erols.com>
from cathexis@erols.com (Set'em up Joe) contains these words:

> But
> what if the vertical was primarily for *recieving*; In this case would
> the-higher-the-better be true? Even if radials were limited to a more
> reasonable horizontal lengths by yard dimensions.
==========
Height will probably not make any difference . What could be a
problem (with all vertical antennas) is the presence of nearby
interfering sources . Vertical antennas do pick up these very well.
Also when near metal stuctures reception/transmission with vertical
antennas can be a problem .
Get the antenna away from metal objects ; if that means putting it up
higher ....just do that !
Good Luck

1447. Re: Ideas for homebrew paddles?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-06 00:00:00 UTC
From: k3bu@aol.com
Message-ID: <20000806194420.02435.00001783@ng-cp1.aol.com>
Source record: 58747

My first home brew paddles were built using contact assembly from the vibrator, the kind was usend in old DC power supplies (not the massage thing :-). It has a set of contacts that are good for millions of cycles, open the metal can, remove the conatcts, mount them on suitable base or bracket, connect the wires and you have eternal paddles for "price" of scrap.
I just built couple more, one to use in the mobile glued to the dash board and one for operation with computer keyer mounted on metal cover for computer slots and slipped under the notebook.
You can make knob out of hot melt glue by forming the blob over the extension of center contact. Spacing is easily adjusted by bending the contacts for proper gap. Nice, small and works.

For Sale: Collection of Hammarlund variable capacitors.

1. New in orginal box, MC-200 M, 200 pf Straight Line Frequency
double bearing style.
2. New, no box, MC 200 M as above
3. New, no box, MC 200 M as above
4. New, no box, MFA 100-b , Double Bearing (has had a knob on
shaft...but not soldered)
5. New, no box, HF 140 140 pf, (Has had a knob on shaft....but not
soldered)
6. New, no box, MC-75-M 75 pf (Double bearing style), Straight Line
Frequency
7. Used, no box, MU-50SX 50pf, double bearing style, double spaced.
excellent condition.
8. New, in original box, APC-100-B, Air Padder

All items except the APC have 1/4 inch shafts 1/2 inch in length. All
mount in 3/8 inch hole or brackets on frame (except the APC unit and the
MFA-100-B which is shaft mounted only. All units are porcelain insulated
and great units for Regen Receivers or small Tube Transmitters up to 100
watts or so.

All unit as noted $40.00 post paid conus

tnx for the read

From: john graesser <graesser@tca.net>
Message-ID: <sos40mmh63a141@corp.supernews.com>
Source record: 58749

I never saw the use for this construction technique, everything I have ever built up to now has been using pc boards.

The reason this came up, is that my stereo reciever, which I inherited from my parents finally died. It was around 30 years old and was the only item in my apartment that still used tubes. Last night I heard it go pop and when I got to it, I found smoke curling up and what looked like shredded cardboard underneath.

When I opened it up, I expected to find a tube blown, instead I found an electrolytic capaciter emptied out and blown out of position. This was the first time I had ever opened it up and noted the neat layout on the tube side of the chassis. Then I turned it over and to my surprise I found that the reciever was built with dead bug construction. This was in a commercial consumer product and looking at all the wire twisting and oddly shaped solder connections it obviously had been done by hand by someone who wasn't interested in how pretty it looked.

Does tube construction lend itself better to dead bug than other forms of construction? Did consumer electronics not go to pc boards until they went to transistors?

If I should buy a tube based transceiver sometime in the future (all mine are transistor based, the oldest an Icom 701) will I see dead bug construction there as well?

I am familiar with circuit tracing and fault finding with pc boards, is there anything I need to do differently with dead bug circuits?
thanks, John.

Consumer products often used PC boards with tubes in the later years.
They were usually a pain in the neck - lots of intermittant board
problems caused by heat from the tubes.

My recollection (admittedly hazy) is that most consumer products up to the 1970's were point-to-point construction, which is sometimes called deadbug.

The heat from tubes did bad things to printed circuit board material, at least the cheap kind you'd expect in a consumer product.

Besides, given the voltages and such, a lot of the components were physically bulky, and didn't lend themselves to printed circuits.

TM-631A mobile VHF transceiver. Dual band, 144/220 MHz. $375

SP-820 speaker. Looks good with all Kenwood HF rigs, closest match to
TS-820S. $75

MC-60 microphone. UP/DOWN, switchable impedance, preamplifier, cable. $80

TS-520SE HF transceiver. 100 Watts 160-80-40-20-15-10 meters. Nice
condition. $275

Shipping not included in above prices.

this is the java bean generic radio interface i came up with a couple years ago for what was going to be a java based contest logging program. the principle behind the interface in the java bean world is to define a minimum set of functions that a bean has to fill to fit into the framework. with this as the 'api' you could then impliment beans for specific radios, then each radio bean would be able to make use of a communication bean that had an interface that would let it talk to radios that could be on serial ports, networks, or any other type of port you wanted to write a communication bean for. the nice thing about 'java beans' is that they are modular. as long as you follow certain design processes they can be installed and customized at runtime, so by only publishing a set of interface requirements you could have many writers supplying small pieces that should all fit together and be interchangeable. the whole project kind of bogged down with the slow start of java, lack of tools in the beginning and other priorities. some of the high level design is still available on my web site at:
http://www.berkshire.net/~robbins/logger
there is an old prototype on there, i have continued to update it a bit but haven't had much time recently to really do anything with it. it doesn't actually talk to any radio since the stock java tools didn't include a serial port interface, there are/were some available as 3rd party libraries but were a bit pricey at the time i was working on this.

some advantages of java for something like this is that it is (relatively) platform independent, it has remote process capabilities for use over networks, and the 'beans' concept makes building modular systems nice.

```
public interface RadioInterface
{
public int getVFOCount(); //radio returns how many vfo's it has

public void setTXVFO(int vfo); //select a vfo to tx on
public int getTXVFO(); //radio return what vfo is currently selected for tx

public void setRXVFO(int vfo); //select a vfo to rx on
public int getRXVFO(); //radio return what vfo is selected for rx

public boolean isSplit(); //is split mode selected
public void setSplit(boolean split); //turn split mode on/off

public Frequency getFrequency(int vfo); //get freq from vfo
public Frequency getTXFrequency(); //get current tx freq being used
public Frequency getRXFrequency(); //get current rx freq being used

public void setFrequency(int vfo,Frequency newFrequency); //set freq in a vfo
public void frequencyUp(int vfo, int step); //step freq up in vfo by step
```

```
public void frequencyDown(int vfo, int step); //step freq down in vfo by step

public void setMode(int vfo, Mode newMode); //set vfo mode
public Mode getMode(int vfo); //get current vfo mode
public Mode getTXMode(); //get tx mode
public Mode getRXMode(); //get rx mode
public void modeUp(int vfo); //switch mode up (does this make sense??)
public void modeDown(int vfo); //switch mode down (does this make sense??)

public void setBand(int vfo,Band newBand); //set vfo band
public Band getBand(int vfo); //get current vfo band
public Band getTXBand(); //get tx band
public Band getRXBand(); //get rx band
public void bandUp(int vfo); //move vfo up one band
public void bandDown(int vfo); //move vfo down one band

}

But, wouldn't the fact that the driver and API layers are running on a
several hundred Mhz machine make their delay negligable compared to the
slower transfer rate of the Internet?

I have, as time has allowed, been working on an netwoek type interface
using Linux. I have a couple of programs on my web site for controlling
Kenwood TS140/440/940's. I have a 140. One in written in C using Xforms
and the other is in Tcl/Tk and runs on Linux, Win95, etc. any machine
with a Tcl/Tk 8.0 port.
My first attempt is just a simple network/serial port pipeline. Next
step is to have a more portable type API server and driver. As time
allows that is.

I don't think they, drivers, will do that. Almost all of the delays are in
the routing of the datagrams through the different routers on a network.

> Too much layering, or an incomplete API can interfere with smooth remote
> radio control even if the other problems (delays) in the system are
> solved. Some method of issuing low-level commands might be a part of
> the specification.

That's how software gets broken! The whole point with GOOD software
engineering practice is to keep each module, and layer, isolated from one

another. The communication should ONLY be through the exported API. Each module should not depend on any data structures, internal routines, etc. that are not meant to be used publicly in any other module. This is what is called data hiding, another software engineering principle.

If a programmer does an end run around the system by issuing "low level commands" not supported by the API, then if the hardware, or the internal software, should change then the application fails! Time and time again I hear about programmers who do this. Then later when something changes internally that their software depended they get bit in the behind. They know better. When a good programer does this its because its the "easy and quick way" to fix something, instead of spending a little more time to design a better solution.

By sticking to a standard published API the manufactures, and programmers, are then free to make any necessary changes to code modules, so long as the specifications for the exported API remain the same. That is the whole point of having a standard API, and sticking with it. Every computer science course, book, etc. should hammer people over the head until they finally realize its good solid software engineering practice!

If there is a need to issue a low level command not supported by the standard API, that should be a big clue the API requirements were not completely analyzed, and specified, in the design stage.

> disadvanages:
>
> 1. Must live on the same system.

Nope. There are applications that run on a user's PC which issues
Remote-Procedure-Calls to a server somewhere else on a network, or even a
different network for example.

The company I work for has the user interface software, for payroll;
inventory; etc, running on a user's PC. The interface software then uses
RPC's to call the database application running on the server. The user's PC
does not care where that server is located either.

> 2. Must be loosely or tightly linked with the application

Well that is the point of having a standard API. The application talks to
the API to do whatever it needs with the hardware.

> 3. Language restrictions.

Nope. As long as the INTERFACE, meaning the size; type; and sequence, of the
arguments, and returned data are published, you can use almost any language
to access the API.

I am too financially strapped to buy a set of paddles. I want to homebrew a set. I have seen articles recently in QST describing paddles made from a clothespin, and another made for mobile use from a plastic cylindrical candy container. Can anyone suggest other designs, or point me to web sites where I can find some ideas. I want to brew the best set I can, keeping in mind a budget of no more than about $15US. Thanks.

> de Will KD7BFX
>

Hey, you should be able to get something used or ?? I know my first
paddle set was a cheap set that was not very expensive. Surely someone
who has given up on cw is out there willing to sell you a paddle set....

Hi Mike,

I had this same problem, no solution. The placement of the 10m tap is obviously the problem, but where it should go I'm not sure. I modd'ed my AL84 to take Svetlana EL509's, similar to the mod on the Svetlana website for the GL1000 (if I recall correctly), and am still having trouble tuning it on 10m. Unfortunately the amp is lower on the priority list than getting the tower up, so won't get back to it for a while.

What it looked like was that less inductance was needed than what was shown on the Ameritron spec. I finally just moved the tap to the input for the coil and it was close but still not right -- only got 200W out instead of about 350 or so expected (given that 10m is pretty much over the edge for those tubes). So tapping in closer to the coil input might do it for the stock tubes. Just don't burn up the tubes testing it!

N8ERO came up with an interesting idea. He basically took 2 pieces of copperclad and glued them to a piece of wood perhaps 1-2cm square or so by about 5-8cm long. He then built a touch detector from 2 CMOS parts. I don't recall the exact details of the circuit but essentially he had an oscillator whose pulses were delayed slightly when you touched the copperclad and a flipflop to detect the delay. The result was a durable, low cost paddle.

It was a little weird at first since it's touching, rather than moving, the paddle, but it only took a couple of minutes to get the hang. I was thinking that this is ideal for operating /M.

It seems to be pretty hard to pick up used paddles for a decent price. Most people seem to buy a Bencher first, and then generally sell them for a pretty good fraction of what they paid. It seems like when someone gets less, they don't sell it because it's not worth it, and if they get more then they sell it for twice what they paid.

Source record: 58836

Andrew,

A vertical is only as good as its ground! Keep that in mind as you look for places to put the antenna! And it si only a verticcal if mounted at ground level. Higher (at least a quarter wave) and it becomes a ground plane, even more affected by the quality of its ground. I think that the old addage "the higher the better" can be dispensed with here! On the ground the antenna will be more susceptible to noise. In the air it will be a better lightening rod!

Ground makes all the difference. Do not be fooled by such things as "over a sea-water" ground plane. I installed a vertical in my back yard in Holland and found that unless I also put in radials for each band (four radials, three bands) I had acceptably low SWR but the antenna acted as a wide bandd dummy load! Installing radials made all teh difference.

I later had the opportunity to compare this antenna to a five band vertical mounted 10 meters high, on my chimmney. I installed radial on both antennas. The performance was not appreciably different! The roof mounted antenna had teh advantage of covering two more bands, that's all.

Install your vertical on the ground and run at least four radials per band it covers (assuming you use a multiband) antenna. The radials should run 90 degrees apart. You won't be disappointed!

A touch paddle something like this was published in QST in August 1981. The article is "An Ash-Proof Keyer Paddle -- Something New for CW Operators", beginning on p. 30. Heathkit came out with a similar design not long after it was published.

Ahhhh...There is really no subscribing or unsubscribing to newsgroups in the fashion you are attempting.

You just select and mark the ones you wish to read from your newsreader such as Outlook, or Outlook Express. If you wish to quit one, you just remove the "subscribe", or selection mark from your list.

If you made it this far there is a very strong likelihood that you have already subscribed.

Well built homebrew HF amplifier on Ebay. No power supply.
Tubes look new. Many high quality parts. Case was hand
made and very well engineered. Low reserve ($75) that's
well worth the cost of the parts.

Yes. You are probably right.

:
: I have, as time has allowed, been working on an netwoek type interface
: using Linux. I have a couple of programs on my web site for controlling
: Kenwood TS140/440/940's. I have a 140. One in written in C using Xforms
: and the other is in Tcl/Tk and runs on Linux, Win95, etc. any machine
: with a Tcl/Tk 8.0 port.
: My first attempt is just a simple network/serial port pipeline. Next
: step is to have a more portable type API server and driver. As time
: allows that is.

Regarding the interface, the human interface should be separate from
the API. I, too, have written network centric interface. Mine
is in Java and was described in the February 1998 issue of QST.
The goal here is to build a common API layer between the hardware
and the rest of the system.

: > Too much layering, or an incomplete API can interfere with smooth remote
: > radio control even if the other problems (delays) in the system are
: > solved. Some method of issuing low-level commands might be a part of
: > the specification.
:
: That's how software gets broken! The whole point with GOOD software
: engineering practice is to keep each module, and layer, isolated from one
: another. The communication should ONLY be through the exported API. Each
: module should not depend on any data structures, internal routines, etc.
: that are not meant to be used publicly in any other module. This is what is
: called data hiding, another software engineering principle.
:
: If a programmer does an end run around the system by issuing "low level
: commands" not supported by the API, then if the hardware, or the internal
: software, should change then the application fails! Time and time again I
: hear about programmers who do this. Then later when something changes
: internally that their software depended they get bit in the behind. They
: know better. When a good programer does this its because its the "easy and
: quick way" to fix something, instead of spending a little more time to
: design a better solution.
:
: By sticking to a standard published API the manufactures, and programmers,
: are then free to make any necessary changes to code modules, so long as the
: specifications for the exported API remain the same. That is the whole point
: of having a standard API, and sticking with it. Every computer science
: course, book, etc. should hammer people over the head until they finally
: realize its good solid software engineering practice!
:
: If there is a need to issue a low level command not supported by the
: standard API, that should be a big clue the API requirements were not
: completely analyzed, and specified, in the design stage.

Exactly. Which is why fast, hard real-time systems often throw the
existing APIs out the window. Interactively controlling a receiver
frequency is a difficult real-time issue. There must be options for
low-latency interactions in the API. There must also be minimal overhead
for moving data between layers or an interactive application will
fail. Computer science books don't write working real-time systems.
They just discuss them. After reading the books, some poor sole
has to make it all work.

There is a web site www.harbach.com
This fellow has a drop in replacement for the power
supply...everything but the transformer. I did this to my SB=200
about a year ago. Price was under $100. He also markets
a soft start...to give some delay to the power on to enhance
tube life. He also has an optical isolator to couple the
exciter/transceiver to the amp. The SB-200 was designed when tube
exciters were the rule. Modern tranceivers are not normally built to
switch the voltages and currents needed to switch from send to
receive. This optical isolator solves that problem. It took me less
than two hours to do all three modifications. He has similar products
for the SB-220

1480. Best soldering iron

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-07 00:00:00 UTC
From: mp <mplanck@my-deja.com>
Message-ID: <8mlj3c$dm3$1@nnrp1.deja.com>
Source record: 58756
Cross-posted to: sci.electronics.repair,sci.electronics.basics,rec.radio.amateur.homebrew,alt.electronics.manufacture.circuitboard

I have been putting off buying a new iron for years, I am still using an old Weller pencil style iron (purchased about 10 years ago) stuck in an aftermarket soldering iron holder.
I am looking for something new and expandable. I have investigated many models ranging from a few dollars to a few thousand. I'm not looking for a commercial hot air SMD rework station nor am I looking for (another) $10 soldering pencil.
Someting in between would be nice however I would have to say that I am leaning more towards the extravagant and substantial rather than the plain and inexpensive.
If any of you are particularly happy with your setup, please let me know what model it is and the approximate price.

If it helps you to make a suggestion, about 80% of my soldering is building kits (mostly leaded components but sometimes a SMD kit) and homebrew 'tinkering' , the other 20% is repairing exisiting consumer electronics type items (not profesionally, I just fix (or modify) whatever breaks around the house).

Requirements:
-It needs to have a very fine point or at least an available replacement tip that is very fine. If an assortment of tips including conical (point), chisel (screwdriver), etc is available that is a big plus.
-Adjustable. Sometimes I need a lot of heat (when soldering connectors, etc), sometimes I need less heat (when using thin solder, working on or near unsocketed ICs, etc)
-Thin, light handle. I'm assuming that most of you will recommend soldering "stations". I have seen some with really big heavy irons which seems silly to me considering that there shouldn't me too much in the iron except for a heating element and maybe a sensor. I'd prefer an easy to handle unit with a thin wire that does not tug on the iron when in use.
-Grounded tip/ESD safe unit.

Extras:
-Expandability. If the unit can have extras added on later I would like this as I am a gadget freak. Especially if an SMD 'tweezer' type iron is available. Also acceptable are those flat replacement tips that look like a chisel and allow you to undo half of a dual inline SM chip at a time. In fact, this is almost a requirement, not an 'extra'. Also neat are add-on solder removal tools (although the solder bulb built into an iron available from Radio Shack is the best unit I've found so far)

-Digital display. Idiot lights for the temp/wattage control are fun to look at but not necessary.

Thank you for any advice you can provide, please email me at mplanck@my-dejax.com (remove the 'x').

Sent via Deja.com http://www.deja.com/
Before you buy.

I have been satisfied with my Weller ofr years, but I still have a liking for my old Antex driven with a lamp dimmer to have control of temperature. Both Antex and Weller have some very fine points, but I do have a special iron (12v) for delicate things like the pins of SMDs. Have never seen one before, but it was bought at Mejdaf in Riyadh.

We all have the occasional need for something REALLY heavy and I use one of those gas soldering pencil sets you get with a soldering iron bit, blowtorch and even a tool for picking your nose. They are a bit heavy on gas so they don't last long when soldering 10' lengths of 1/2" copper plumbing pipe, but they do the job great, and only about $5 for the complete set. If you are not doing regular heavy work then these things are ideal. Forget the ones that have a plastic body and are made to look like a pocket pen (cheap plastic), get the handheld blowtorch made to look like a handheld blowtorch, with a metal body.

So there you are! You asked for personal preferences, those are mine. Antex/Weller (both grounded) and a blowtorch.

Incidentally, the best way to remove an IC from a PCB without damaging either is to tip the PCB upside-down, hang a couple of pounds weight from the chip using a big (battery charger type) aligator clip, then heat up the top (underside) of the board with a blowtorch. A 40-pin chip drops out in a couple of seconds and no damage to either.

Who on earth decided it would be a good idea to PAINT it? I would have
easily paid well over your asking price if iw had the original knobs and
front panel. If the knobs were broken, then you only need one to make a
mould to make the rest.

I don't suppose you have a 'dynamotor' for the No.19 set? or the
microphone/headphones?

I have a matched set of 4cx800a Svetlana tubes for sale. These tubes have never been used. They are Soviet military surplus, and were made to very rugged military specs.. These tubes will produce as much wattage as any Svetlana 4cx800a tube sold by any distributor, period. The price for the pair of tubes is $200.00 plus $10.00 shipping to anywhere in the lower 48.
I also have a set of 4cx400a Svetlana tubes. These are also in great shape, never used, and made to the same rigorous military standards. The price on the 4cx400a tubes is $180.00 plus $10.00 shipping.
There are a bunch of old Dentron MLA-2500 amps out there that need a good tube to replace the impossible to get 8875. There are a couple of articles on the Svetlana web site showing how to use both the 4cx800a and the 4cx400a as replacements for the 8875. Just go to the Svetlana website and look under technical bulletins. They also have an article about replacing the 8875 with a single 3cx800a7. But had you rather pay about $350.00 for a single 3cx800a7 or 200 bucks for a pair of 4cx800a or 180 bucks for the pair of 4cx400a?
You can find out more about the tubes on my website link at the end of this message.
Thanks for your time.

Howdy Kelvyn....Making some likely assumptions about your TX SPICE model being that its output will be designed for max transfer into a 50ohm resistive load.....short answer (well, mine) would be that the 50 ohm resistor will simulate the TX load ok but not an antenna (it would be a dummy load). Of course you likely knew this so I might suggest that you gear up a load model with a little variability ....say 5-100 ohms resistive and with some J reactive offsettability....just to "sweep" your Tx block and see what it might do in the real world, with imperfect antennas (If it's output drops off drastically when deviated slightly off of the perfect load, it might be more of a pain to the user down the road)....just a suggestion.

I worked in a radio/TV shop in the early 60s and ran across quite a few TVs and car radios that used PC boards with tubes. As I recall, some were combo units with tubes and transistors. Some of the car radios ran with 12 volts on the plates.

Howdy all.....Is it just me or have all the manufacturers of transformer type guns gone simple with their use of side screws to hold (!) the tips in - the old Weller (and the many badges it wears) 100/140W was a favorite of mine for years EXCEPTING the poor old plastic/bakelite type case which used to be poor for falling apart after awhile (unless you stored it on a pillow!). These new variations are junk period....the heavier duty gun is no different (D550) now and with both of 'em I've had as little as a few solder joints made before the heat was poor....and maybe once or twice tightening before the barrels (now aluminum) were scrap. Have an old Ingersoll-Rand that used side screws and used to think it bad (in comparison to the "old" type of end nuts) but it was infinitely better than these new types (heavy ends...and steel barrels). Have tried a WEN gun in desperation...which is ok but sure heats slow by comparison to a good transformer setup. Does ANYONE out there know of a quality transformer type gun on the market...preferably that uses the Weller type tips (tons of 'em on the market everywhere around here). Yes , I use the careful irons for the little and sensitive work - some handy to have a big old gun for big tube stuff and my other trade (automotive/truck/marine electrical) work.

what say?

Will,

I used a couple of sets of contacts from junked Turner CB desk mics.
I found an aluminum block about 1" wide, 2.5" long, and 0.5" thick
in the trash at work and used it as a base. For finger pads, I took
some scrap PC board, cut two pieces to the desired size, and soldered
them to the mic switch contacts. The total cost was $0.00; it just
took a bit of ingenuity and application of thought. Give me some time
and I can snap a couple of photos and email them to you (actually, I
should post them on my web site too). Open-frame relay contacts ought
to work just as well.

For a good GP iron, the weller WTCPT is hard to beat. Should run between 100
and $150 dollars. many tips available, temperature set by the tip.
If you need more precise control, the weller 2002m-2 would be a good choice.
LED digital read out, variable temp control. @250 to $350 cost.

Other companies build good stuff also. Hakko, Pace, Metical, and american
beauty
are other industrial type soldering equipment makers. Good luck.

What you refer to is called point to point wiring. Soldering parts over an unetched board (ground plane) with IC's upside down is called dead bug construction. It's mostly used for experimenting or if you need to build one unit only.

Vacuum tubes produce a lot of heat therefore circuit boards develop problems after a few years.

1492. Help winding a transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-07 00:00:00 UTC
From: WB3KUM/9 <breedend@NO.excite.SPAM.com>

I am in the process of winding a transformer for a HB project. I thought I remember reading and doing 2 wraps per volt as a teenager. Checking the internet, I saw one place advertising for sale transformers with 1 wrap per volt. I have two ARRL Handbooks (older). One says 5-7 wraps per volt, the other says 6-8 wraps per volt. The transformer has a center core section of about 3.5 sq inches and about 2 inches deep. The reference in the handbook was 1 sq inch.

I would like to do 5 wraps per inch, but I don't know it I have enough room for that with the 5 winding I am putting on the transformer.

Spec.
600V secondary B+
250VCT secondary low B+/bias
117V primary
6.3 filament

350W ICAS

Core is an old transformer out of a 500W microwave oven.

Many thanks

Dennis WB3KUM/9

Well, if you're willing to spend around $500 (a lot less if you can
find a surplus seller), the Metcal is really tough to beat. They are
used for just about anything from the smallest surface mount to *BIG*
stuff (for instance, we needed to close some holes in a tin-plated
steel chassis to try to pass RFI, so I got a fairly large tip and
soldered covers in place on the 2' x 2' hunk of .080" steel, this is
the same iron I use for fine pitch SMT!).

Tips cost around $25 each and are available from super small to big
ones designed for removing big PLCC's. The real neat thing about them
is that the tips are hot and ready to use in about 10 seconds. To
change tips, the old one is just pulled out and a new one pushed into
the pencil type handle. See http://www.metcal.com for more info.

No, I don't work for Metcal, I've just been using them for 10 years.

I'm building a 1 KW antenna tuner along the lines of the Ultimate Transmatch from the ARRL Handbook. I'm looking for two big air variable caps that'll handle 1 KW or better, with a maximum value of at least 300 pF, and preferably more like 400 pF. I also need a turns counter for my roller coil. Nothing fancy, but something usable. Lastly, I could use a toroidal 4:1 balun. I could buy a set of cores and some insulating tape and wind one, but it would be nice to find one already made, perhaps from a commercial tuner that someone is junking out.

RPC is hardly an conventional API. RPC is a real pain to use and the
Unix
RPC is different from WinTel RPC.

>
> > 2. Must be loosely or tightly linked with the application
>
> Well that is the point of having a standard API. The application talks to
> the API to do whatever it needs with the hardware.

I agree!!!!! That why I don't think they should be linked with the
application.
Having a stub object detaches the API from the application. This keeps
"clever"
programmers from by passing the API. Different thread will comment
later.

> > 3. Language restrictions.
>
> Nope. As long as the INTERFACE, meaning the size; type; and sequence, of the
> arguments, and returned data are published, you can use almost any language
> to access the API.

Not always. Try calling a Java object from C++. I do agree in a lot of
cases
it is possible, but not always clean. JNI is an example of a fairly
dirty
interface layer.

Leland, I am not sure if this is the best place to air our disagreements
(may be too strong
of a word as most of the time I find that I really agree with you but
just
looking at the issue slightly different).

Real time is somewhat of a special case. The solution however isn't
to make a end run around the API, but to create a new set of real time
APIs. Anything else is leaving the appl programmers out to dry.

My first paddles, way back when, before I got my Brown Bros. BTL-A for Christmas (thanks, Mom & Dad. I now have a collectible!!!), was fabricated from a pair of RadioShack straight keys fastened vertically back-to-back.

Take a nice wood block for the base, screw a standard hardware store angle iron in the middle with the vertical section in line with the paddles. Remove the knobs from the two keys, make a set of paddles from plastic or pc board. Screw the two keys together back-to-back, making sure at least one of the screws goes through the angle iron. Wire the posts together for common, and run the dot wire to one key and the dash wire to the other. Just adjust the spacing to your liking.

If you only run one screw through the angle iron, you can tilt the pair up or down to match your hand. Worked very well until I got the real paddle.

BTW, my first (and still only) keyer was the WB4VVF Accu-keyer (non-memory) built out of the Handbook. Had to replace the pc board about 12 years ago (the original had been in and out of a variety of cases, and the pcb traces just gave up.....) but fortunately, my Elmer had bought a couple of extras back in the old days and he gave me one.

Simple and reliable. Used a mercury relay to key my Heath DX-100b and then pulled the relay when I got my 520s.

Good luck.

After twenty years of putting up with Weller stations constantly giving me trouble with their poorly designed heating element switches, non-durable tips, & other assorted nonsense, I finally broke down & bought a $36 Solomon station from Dalbani. After replacing the cheap & defective pencil cable with some nice mic cable, I must say that I am more impressed with it than I have ever been with Weller, although I would still like to get a Hakko sometime. This cheapass station has a fast ceramic 50w heating element & adjustable temp(to about 900 degrees) & a nice variety of tip geometries(although you can only buy the six tip assortment @$19 so far). Nice ergonomics, too. My Weller WTCPT went in the trash can, along with the WCC-100.

If you are going to use the original primary winding on the microwave transformer, try winding ten experimental turns over it and see wht voltage you get. Some calculating will tell you how many turns per volt. If you're going to strip the core bare, count the primary turns as you take it apart. #turns/120 will equal turns per volt.

I don't know if any of the low-voltage Weller irons (24V elements, I think) are available for that price range, but they rule. I just picked up a WS80 ("silver series") outfit at Fry's for around $195 a few months ago, and it's the nicest soldering iron I've ever used. It's about half the size and weight of a normal 35/40W iron, and the tip heats up as fast as a 240W soldering gun. (No kidding.)

The initial cost of the iron is a bit steep, but replacement tips are only about $2 each.

I believe there are similar-looking Weller stations for less than $100, at lower wattages. You might buy one from a place that'll let you take it back if you don't like it. I like to have a lot of power for soldering/desoldering PC board shielding and the like, so I sprung for the 80-watt temperature controllable version... but you may be able to get a good general-purpose iron from the same product line for a lot less.

I'll "reprint" what I just posted to another guy asking about soldering
irons:

-------quote-------
I just picked up a WS80 ("silver series") outfit at Fry's for
around $195 a few months ago, and it's the nicest soldering iron
I've ever used. It's about half the size and weight of a normal
35/40W iron, and the tip heats up as fast as a 240W soldering gun.
(No kidding.)

The initial cost of the iron is a bit steep, but replacement tips are
only about $2 each.
-------end quote-------

Anyway, the WS80 may not be competitive with the Metcal gear you're
considering but I'm more than happy with mine. The tip that it comes
with sucks, though -- you will want to replace it with an LT1 tip for
work on anything smaller than 100 mils.

I would not say disagreements either, true, but we do have a different angle
of how we look at the problem. 8-))

As a another comment about a standard API using RPC's, Real Time OS, and
mixed language calling, etc., we are really talking about two issues here.

A standard API is a "design" issue ONLY. How that design is executed is an
"implementation" issue. These are not the same. We can have a bad design
implemented on a very fast system, or we can have a great design implemented
by a kid who can't program his way out of a paper bag. I think too many
people get these two concepts mixed up. If you get poor performance how can
one be so sure it is a design problem with the API, or the API concept it
self that is at fault?

I have some data which may help.
If your core is 3.5 sq inches the Turns per volt would be 1.79.
As I do not know what gauge wire you are using etc., I cannot determine if any particular winding will actually fit in the space given. If your xfmr is the size of the beast that I have (same source) you will have no trouble there. If you use the above figures you will get the correct voltages from your windings
I have done many xfmrs over the years and I developed a program in my computer to do the calculations. Be advised that the figures the others gave you MAY be right for THEIR xfmr, but theirs may have a different core area etc. which changes everything.
If you require a fuller calculation for your winding, please e-mail me direct at parrfo@sympatico.ca with voltage, current required for each winding & I will e-mail the results to you asap
Regards
Jack Parr

If your work is going to be network based and TCP/IP is the transport (or one of the transports), you may want to have a look at some of the RFCs related to realtime enhancements to and layers on top of IP. Many of the hard design issues for realtime-over-networks have been addressed. Audio/video streaming over IP depends on it, of course, as does IP-based video-conferencing. For example, I take care of video-streaming servers which are RTP-based. See the IETF workgroup web pages for audio/video transport at http://www.ietf.org/html.charters/avt-charter.html

As another example, remote videocamera control over IP has been done for at least 3 or 4 years in experimental settings. Also have a look at the IETF workgroups for quality-of-service issues at http://www.ietf.org/html.charters/rsvp-charter.html

Try an 80-watt WS80 pencil before jumping to any conclusions. You're in
for a surprise (I know I was). You'll swear the thing defies the laws
of thermodynamics.

The ability of that iron to put a lot of heat into a large piece of
metal is very impressive. I keep a dual-range gun on the bench too --
on a Variac cranked up to 140V no less -- and I haven't had to fire it
up once since getting the WS80.

Hello--
You're describing point-to-point wiring. It's brobably easier to trace than primitive single-sided PC boards, and much easier to trace than double-sided boards.
Also, FWIW Sears used an interesting construction technique in the mid-1960s--insulating board with perforated strips of metal that formed the connections between tube pins and component leads (Warwick Electronics was the supplier for these models). I never liked these boards-- they had all the disadvantages of discrete wiring and PC boards, and none of the advantages<g>.

The few times I've had to work with a Weller, it's been rare that the tip would last one entire day. By contrast, I've had my Hexacon since 1975 (or very close to that), and I'm on my third tip. Of course, I'm going to have to pick up a fine-point tip for SMT work now. And I do have to admit the tip I'm currently using won't last another three years.

Perfect for homebrew transmitter:

Triad R-26A. Never used - no rust, just a few very light scratches on back.

Primary: 115 VAC
Secondary #1: 6.3VCT @ 8A
Secondary #2: 6.3V @ 3A
Secondary #3: 6.3V @ 1A
Secondary #4: 5V @ 3A
Secondary #5: 880VCT @ 200mA with taps at 720VCT

$65 plus shipping from 98028 (Seattle area)
Pictures available on request.

Terry K8TP

The ultra-fine LT1 tip I'm using right now seems to be holding up pretty
well. I bought half a dozen of them at Fry's for about $15, thinking
I'd go through them pretty quickly, but it hasn't been a problem yet.
Of course, I don't usually run the temp control hotter than 650F, and I
also don't leave the iron on all the time since it heats up so quickly.
That might help some.

This install sugestion is elaborate, but worth while if you wont to protect your equipment and your vehicle. This also adds the benifit of opperating with your ignition and motor turned off.

Purchase a quality battery, a dry cell or gell cell is ideal, especially the marine type that can handle being drawn flat dead and recharged without any problems. Install a battery isolater ratted around one hundred and fifty amperes. Connect your power cables to this new battery, be sure to fuse both your power and ground cables. Do not forget the ground from frame to battery. Connect the isolator to both of your batteries and then to your alternator. For added protection against line voltage drop you can home build a capasitor pack, the larger the pack the more voltage change at high current it can handle using appropeitly ratted parts.

Not, your radios are isolated from your vehilcle electrical system and the only interference possible is from RF. Propperly sheilded cables will take care of this aspect. Best of all, now you can opperate without burning up a tank full of gas!

Opperating time is about and hour at full power and steady use. Charge time, as long as it takes to get where you are going. I run this set up in my 98 Ford F-150 without any faults.

Been using Xytronic for over 10 years.

The only problem I had, or have, was buying a discounted (greatly)
model, that was out for a year or two, and they quit supplying
tips for it, allthough I can modify some of the newer tips to
fit. Jameco was willing to settle. They also have most of the Xytronic stuff.
There is even a desoldering station for about $300.
Xytronic also has a web site, I had talkied to some of them in Taiwan.

Yes, but.....The implementation made at Ohio State Univ. which I saw
a few years back was actually part of an H.263 videoconferencing stream
with camera-control add-on (assuming my memory is reliable), so the full
data stream included realtime video feedback (MPEG1 if I remember) and
audio channel. Obviously this is closer to realtime radio control
requirements.

I believe that the IETF RTP website which I mentioned above has some
drafts on videoconferencing payloads on top of RTP. Also, I should have
mentioned the IETF diffserv workgroup which studies the quality-of-service
issues which will be important for realtime commodity-internet (as
opposed to realtime radio-shack-intranet :-)

One can't claim that RTP and RSVP will necessarily dominate realtime IP in
the final analysis, or even that realtime IP itself will dominate. It's
going to take a while for the dust to settle. I just wanted to point out
that public standards and vendor implementations of RTP and RSVP do exist,
and that it might pay to build on that previous work.

This is very interesting stuff and I would very much like to see us
get to the point of using RTP, but I think it will be awhile. I like
CORBA and RMI, but they will haven't matured enough in the PC space
to make them workable yet.

I would like to suggest that the goals of SDAR be as follows:

1. Conventional API Standards Spec and code created with distributed
concepts in mind.

a. Radio Control Standard API
b. Log file format API
c. Rotor control
d. Digital Keying both CW and Voice
e. DSP

2. Convert the above API into a distributed system such as CORBA, RMI,
COM,
DCOM, XML-RPC or RPCs.

3. TBD

Of course much of this could be done simultaneously. The two important
things
for me is that it remains Open and OS independent.

From: Anthony Roskilly <Morse.Key@btinternet.com>
Message-ID: <8mpr1c$so6$1@neptunium.btinternet.com>
Source record: 58704

Hi,
I purchased a secondhand Yaesu FL2000B linear last year from a dealer, the linear
had had a pair of new 572Bs fitted. I have tried to reduce the SWR seen by the
exciter (TS850S) by apply the technique in the handbook. ie
Disconnecting ht secondary, setting 100mA drive and dipping the Plate, then
adjusting the appropriate input coil for minimum input SWR.

The lowest SWR I can achieve is about 1.6 : 1 on 15Metres, on 10,20,40 and 80 Metres
the lowest SWR is about 2:1.

Are these figures reasonable?

I guess that as the FL2000B is of the vintage when the exciter would have had a
valve (tube) PA with output Plate/Load controls, thus would have taken up any
reasonable mismatches on the input.

I have made up a simple PI section ATU to match the TS850 to the Linear

'Dead bug' construction is a name for an assembly technique where the IC's and transistors are laid upside down on a piece of blank copper clad circuit board material. The remaining components are then wired to the IC and transistor leads. The IC's in this technique look like dead bugs...hence the name.
What you have is a piece of pre-PCB equipment...before there was such a thing as printed circuit boards. In these older vintage equipment, the components were wired point to point between the tube sockets and other terminal strips. Back then, the term 'dead bug' was not yet coined. It was the only way to build electronic equipment.

Re: 'Soldering station'.

What features does a soldering station provide other than a place to 'park' the iron between melts!

Seriously though, I presume it provides some form of heat control and/or some means of cutting
down the temperature of the iron tip in between soldering sessions so as to minimise the charring
and contamination of the soldering tip?

Would anyone care to expound on the subject of soldering stations, their design and advantages?

As posessor of several 'irons' of 230 and 115 volt vintage, and wattages from 65 to 15 have been
thinking I could possibly construct something for my occasional hobby activities. When people start
mentioning $300 to $500 I start thinking about a piece of equipment, not a soldering iron! Also
have a soldering 'gun' infamous for being slow to heat up, unless I make my own slighter tips out
of copper wire! Was thinking of 'overvolting it a bit' maybe 10% thus increasing wattage by approx
20%. Only intermittent use anyway?

Funny how they are called 'Irons' though!

BTW I have two ancient tinsmiths 'Coppers' bought at a flea market. Occasionally useful, can heat
them with anything from a hob on the electric cooker to a campfire!

Anyone?

Hi Will,

I know your dilemma... well! I see that you have several responses to your query. One that you might duplicate very easily is the one where the user suggested using a couple of micro switches. I use one for a straight key and it works well. I don't see why two wouldn't work well configured to key a keyer.

Well, your message sparked my building instinct and I thought, "I should go to my junk box and put something together." Well this morning I did. It took me about 4 hours to search out suitable parts from the stuff I've accumulated over the years and put them together. First, the base was formed from two pieces of plastic about 3/8" thick. (One piece came from some old wear-strip and the other I cut from a garage sale cutting board.) Then I found a replacement set of contacts of suitable size which were sandwiched between two end stops from an old terminal strip. The paddle plastic pieces came from a package for steel leader that I found in my tackle box. So, you see how important the junk box is? You have to be able to know what to pick to configure your final product.

By the way, I've had this one on the air for a three hour QSO this afternoon. I need to put some weight on the base or contrive some way to hold it. Otherwise, it has excellent feel and sensitivity. At any rate, I will be using it now instead of the Bencher.

Here are some pictures if you care to see what the finished product is.

http://www.users.dmi.com/blinn/PaddleP8080001.jpg

http://www.users.dmi.com/blinn/PaddleP8080002.jpg

http://www.users.dmi.com/blinn/PaddleP8080003.jpg

http://www.users.dmi.com/blinn/PaddleP8080004.jpg

The last picture shows a couple 4-40 screws that worked in well for adjusting the clearance between the contacts and the brass screw I used as the common terminal. (The brass screw head was turned down by chucking in my drill and holding against a small belt sander.)

The cable goes into the base through a hole drilled into the seam between the two base sections.

Have fun, no matter what!

Regards,
Bill - WA7TQK

On an allied topic, are there any irons capable of operating off a 12VDC car battery? There have been times I've needed to solder something remote from AC mains and for safety reasons it would be nice to not use an open flame device.

Exactly. Soldering stations regulate the temperature of the tip. This allows the use of a fairly powerful heating element (often 70 watts or more.) This allows the tip to recover quickly when it loses heat into the item being soldered, but doesn't let the tip get too hot. Too high a temperature will not only shorten the life of the tip, it will lift pads off PC boards.

The temperature may be fixed or adjustable. Some stations have locking adjustments so the supervisor can set them and the workers can't change them. (Some assembly line workers tend to crank the temp up to the highest setting to get the work out faster.)

As for which station to buy, I like the Hakko 926 ESD. I'm not so fond of the newer Hakkos--they have a separate iron holder that tends to slide all over the place.

Consider a lighter gas (butane) catlytic burner iron. Portasol has a catlytic burner/bit with a capacity of equivalent 100 Watts . Excellent to use outdoors - low weight - cordless easy refill from a Ronson or similar butane lighter gas can.

==========
For a 35 -60 W soldering iron it might be very worthwhile to consider
a gas powered iron with catalytic burner.
There are various makes : Weller -Portasol -Antex etc .
Advantages : -adjustable heat output - light weight - cordless -
various integral catalytic burner/bits available.
Fuel used : Lighter fuel (butane) from a can available everywhere.

Good Luck

==========
You could consider a knob of a ten turn potmeter combined with a 3:1
spindle reducer used the other way around . The usually 14 turn knob
combined with the 1:3 (reversed) reducer would give 14* 3= 42 turns
on your roller coil . If not enough you can use a reversed 6:1
reducer which would allow up to 14*6=64 roller coil rotations.

I'm another electronics professional who used to use the Weller WTCP series soldering irons until the parts (especially the switches and heating elements) got too expensive. I haven't thrown them away yet (being a packrat) but none of the two or three Weller WTCP units I still have are in working condition these days.

I started buying the Tenma brand soldering stations from MCM Electronics a little over 10 years ago, and they are all still going strong. These soldering stations are similar to the Solomon one from Dalbani mentioned above, but not *exactly* identical as the tips and heating elements don't interchange between the two brands. But a

complete replacement soldering pencil with cord, plug, and new tip for the Tenma unit is only about $12 from MCM, so I don't bother trying to repair the Tenma pencil units when they wear out anymore.

The entire Tenma soldering station (base with soldering pencil holder, power supply and variable temperature control, soldering pencil, sponge, and tip) is only about $60-70 at MCM when on sale. Well worth it if you are going to use it more than once a month.

The continuously variable temperature control of the Tenma or Solomon soldering stations is one of the best features, as you can turn up the heat for large work and turn it down for delicate stuff. Or turn it down really low if you don't need it for 10 or 20 minutes: Then it recovers full temperature much faster when you crank it back up than it would if you turned it off. On the Weller WTCP units, the temperature was permanently set by the tip itself, so you couldn't turn it up and down. If you left the Weller WTCP on all day, the (expensive) tips would wear out quickly. But it took too long to heat up if you kept turning it off, since there was no "low" or "medium" heat setting.

For surface mounted capacitor replacement, I just recently got one of the SF tweezers type units, but instead of paying several hundred $$$ for a new one, I found a used (but in perfect condition) unit on eBay for about $70. Before I got the tweezers I was doing the capacitor changing by using TWO of the Tenma soldering irons, one in each hand. It took a little practice, but actually worked very well for changing surface mount electrolytics in camcorders. You will also find some of the industrial grade desoldering tools with the built in vacuum pumps on eBay from time to time for a fraction of their "new" price. When I see one for the right price on eBay , I'm going to get one of those too.

This is a complete subject in itself, and soon to become a dead art! To wind a transformer, there is a formula (that I have forgotten) for calculating the total power capacity of the former/laminations you have. If that is big enough then it is safe to continue.

Calculate the wire size you need for all windings to take the currents (using another formula that I have also forgotten), then using the wire data, calculate how many turns/volt you can have for the former winding area you have. There is a range of flux density that you can assume, if you do not have data for the iron core material you have. You can also check the turns by putting the number back into the formula and checking you have the right former area.

As long as the former winding area is the right size, then you will have the right number of turns/volt. I will see if I can bring the data to work tomorrow and give you the info and formulas and tables you need. I have wound loads of transformers and all "run cold", but in the meantime you can take your laminations and clean/laquer them so they are insulated from each other when you assemble the former again. One of the big problems with re-using transformer cores is the eddy currents caused by laminations shorting together. This is one of the main causes of the transformer buzzing and getting hot.

If you wish, I will see if I can scan my lab book and e-mail you the pages, but it is all hand-written. No promises; I am rather busy at the moment having just moved house. When you buy a house, you don't buy a home, but another full-time job!

Funny!! I have never had any trouble with Weller TCP. I have had perhaps two of the switches go down on me, and replaced loads of bits, but that is only to be expected with any iron. I am still highly delighted with my Weller and Antex. The present range of bits I have in use have been in service for the past 5 years, and that is with an average of over an hour a day for the set.

It is also interesting that many manufacturers also use Weller as standard tools for factory-floor staff. That in itself must say something.

Easy. Take two ordinary ex-govt keys, tip them on their sides and bolt them together. Remove the knobs and screw two bits of plastic to the shafts. All you need to make is a simple inverted T bracket to use as a base and to bolt the keys on. Look at my drawings on the page http://sm0vpo.8m.com/use/simplek.htm You should be able to build the paddle for just a couple of bucks, assuming you buy everything.

I have been using verticals, almost as you described, for many years and found that increasing the height of the 1/4-wave does not give any significant advantage; maybe a dB or two! If the antenna is mounted at ground level then ground radials are a good idea to beef-up the Earth a bit since the ground resistance will limit the antenna current. the only exception to this is if there are buildings and obstructions in the vicinity. A 1/4-wave in the garden of an 18-storey block of flats will be useless.

If you wish to increase the height then you cock-up the grounding availability and the length of the support structure will also become a part of the antenna. You have to get the earth resistance down again. 1/4-wave radials will do this well, you can also slope the radials to change the radiation angle. A 45 degree slope on each of the four radials will give you a good low angle for both general and DX work. You can also prune the radials to slightly different lengths to give the antenna a slightly wider bandwidth.

The vertical 1/4-wave antenna does not have a DC short to earth (if using a simple coaxial feeder) and this can give rise to static charges if your receiver has a capacitor input. Put a 10K resistor across the base of the antenna between the element and the ground. You will hear a noticeable difference under certain weather conditions, or during dust and sand storms in dessert areas.

You can simply parallel several antennas to the same coaxial feeder if there are typically four radials for each frequency band. If you have, say, four bands (3.5MHz, 7MHz and 14MHz) then the 18MHz band may not even need any radials at all. Just suck-it-and-see if you can get away with it! You can get a reasonable sized element for a particular band by placing a big coil between the element and the centre of the co-axial cable. I use a 5.4 metre vertical for 14MHz, but the same element works well on 3.8MHz with a coil of 53 turns, 10cm Dia., 1cm turns spacing using 5mm copper brake pipe. See the picture and photographs of my Balcony Antenna at http://sm0vpo.8m.com/antennas/balcant.htm although this vertical has a different ground arrangement for those living in appartments. Incidentally, using this antenna I have had contacts with both Japan and Tasmania, to mention just two, using just 50-watts of SSB.

As long as there is nothing to breakdown, these antennas work just as well for transmitting as receiving. If your antenna is moved or adjusted and the TX signal all goes to crap, then so has your received signal.

Finally, remember that the 35 - 70 ohm feed impedances are quite low, but if you could measure the impedance along the antenna you will see that it gets higher as you move up the element. This means that the conductor you use for

the element only needs to have a low impedance close to the feed point. It also means that you can use other materials for the top section of your antenna, such as the rest of the living tree itself!!! Use your imagination. As a rule of thumb, if a tree is used as the last 50% of your antenna, then you should reduce the length of treetop by 20% if there are loads of branches.

I think I have covered all you asked, and a little more besides, just to set you thinking.

I think this is a key point. There is nothing magical about KVG filters,
other than at a certain time they seemed to be readily available, and were
specified in many construction articles. Before they appeared, a lot of
articles in North America specified McCoy filters.

So long as one has information about the input and output impedance of
some other filter, and modifies the associated circuitry, then anything
will do. Keep in mind that the bandwidth may vary, and the shape factor
may vary,
but that doesn't mean KVG filters are the only way to go, only that
an exact drop-in replacment may not be available. Depending on the
use, lesser specs may not be a problem.

I think you will find that the 4 are more than sufficient and that the 45 degrees brings the impedance up to a good match for the cable.

Don't use the tranny from a microwave unless you can find and remove
the flux shunts. If you do not remove them, the regulation will
positively suck. Ask me, I know. I built a 400w 4CX250 amp based on
a microwave tranny. What a learning experience!!!.

Howdy Jack....See you asking about 12vdc solder irons....Answer is yes they are around - Tell you where I'm seeing them most often, truck stop shops! Nice looking little pencil though I've not tried one out yet. The type of soldering I often do, mobile or outdoors, sees me using a small butane torch - pretty slick - not the ones using a modified cigarette lighter inside but the kind with an approx 1-1/2" barrell - Hold a LOT of butane and you can solder everything from small multi-pair telephone cables to battery lugs (I routinely put 1/0 or even 2/0 cable into large lugs with this unit)....super for putting on a few soldershrink connectors also (for very many I'd use a heat gun of course).

One disadvantage of fancy stations, I used to comonly live solder components,
as the tips were basically insulated. Also, never really noticed any
components breaking down due to ac static on the iron.

There are some good buys. Most good ones have grounded tips, using
3 wire ac. Cheaper ones have power control, not temperature control,
but they work. Look around $30 for cheap.

Weller used to advertise as instant heating. I also used to make tips out of 12 guage
copper.

I now have a Radio Shack, pretty big, about 250 watts.

I'd vote for Metcal equipment.

They're particularly good for SMD's. I work for a very large electronics manufacturer and we've had good experiences with them. they aren't cheap though. You can check 'em out on their website.

Does anyone know how to "access" the AUX position on the unit I have.

It's the in dash single CD AM/FM unit.

The "mode" switches are labeled AM/FM and CD/AUX

I would like to utilize it for another audio source(amateur radio
transceiver).
I've done this on another vehicle and nothing works better than the vehicles
speakers...lots better than better looking than an outboard speaker.

If anyone has a wiring diagram of the inputs/outputs to this unit I would
appreciate it

Thanks and 73(for the ham radio folks)
Greg

Wahl Clipper Corp makes a battery-powered iron which has an integral rechargeable battery. I prefer the Portasol butane irons for portable use. They'll run a lot longer, and will produce a lot more heat (often necessary when soldering antenna wires, especially if it's breezy). The Portasols don't have an open flame, but do have an internal glowing catalyst.

Now, there was lots of PtP wiring done in equipment after PCBs became
practical. One example was Zenith with their "handcrafted chassis".

That weld is the flux shunt. Look for single turn copper bands or wire, usually 180 deg. apart surrounding the core. If you can break these off, your O.K. Also a hidden shunt is through bolts in the laminations that do NOT have insulating washers, these bolts will also shunt current and increase primary current and add heat. The micro tranny may be stacked as separate "I" "E", interleave them for your project. They have flux shunts to keep the external magnetic field low, else transduce into the metal cabinet! Heat the cabinet and hum like hell.

Charlie

As an electronic engineer I have surprised by the memory option of a great receiver : YAESU FRG7700 (also Sommerkamp). It not usual to find in the electronic world a twelve memory chip. I have discovered that YAESU put a twelve position rotary switch just to keep money.
If you have a look on the memory circuitry, you will easily find as the adress bus : 8 wires. And it makes 256 possibility to adress the memory. So to expand you FRG7700 from 12 to 256 memory you just have to disconnect the adress bus from the front side rotary switch and to connect it on two "roues codeuses" in FRENCh (sorry I don't know the translation.

He's talking about real irons, that date from before that newfangled electricity stuff. You had to heat them up in some way, and a campfire often was the available source of heat. The mass of the iron was supposed to keep the heat in for a while, and after soldering you'd return the iron to the heat source for "recharging".

Think "branding irons" that seem more familiar, though I have no idea whether they've become electric at this point.

Or old irons for ironing clothes. They looked like the present irons, albeit minus the electric cord, and you'd heat them up off some heat source, I imagine the wood stove was the convenient source, and then iron away.

I once saw an old American Beauty soldering iron of the electric kind, must have been at least 100W. This was the sort of thing common in electronics years ago, when real heat was needed because you were soldering bulky components, before soldering guns hit the scene, and before semiconductors made small irons a necessity. It's easy to picture that baby without a cord, sitting in a fire (or on the top of the stove) heating up for the next connection.

Best guess? Probably an RCA jack on the back. Most commonly used to add a changer or TV to the system (using the radio speakers for sound for the TV).

Nuther possibility is to come out under the bottom edge of the siding.
Drill through at a steep angle. This works good, except in termite country.

I once did a nice pass-through using 1" white PVC pipe... I happened to have an 18" drill-bit extension that had a 1 1/4" hole-saw mounted on the end, I had recently used that rig to drill out the mufflers on a new Harley) so I put the hole saw with extension back on my drill, picked a nice spot high on the inside wall, and near a window, and drilled right on through to the outside. I drilled at a slight upward angle; maybe 20 degrees.

Then I put a 90 degree "elbow" fitting on one end of a 10" piece of 1" PVC pipe, went outside and found my ladder so I could climb up and stick the pipe through the hole I had made. I used "Liquid Nails", a construction cement, to fix the pipe in place and seal up my wooden siding so there would be no leaks. I pointed the end of the "elbow" down toward the ground.

I gave the "Liquid Nails" a day to dry, then I sawed the extra pipe sticking through my interior wall so that it stuck out only 1/2" or so. Then I used ordinary window caulking to "cover the ugly", using a wet finger to create a smooth fillet around the pipe and fill the gap. (Yes, I used spit to get my finger wet.) I gave the caulk a couple of days to set up and dry out a bit, before using the pass-through. That's optional, if you are in a hurry. Last, I used "Coax Seal", that gooey black tape-like stuff to seal the outside of the PVC "elbow" once the coax was in place. The elbow already points down, promoting the use of a "drip loop" in the coax, so water isn't a big problem. Still, there are dust and bugs to consider.

The pass-through looked fairly official, and did a good job. I'd recommend a bigger PVC pipe/Hole-Saw combination, though, if you have more than one bit of coax to route.

Safety Tip: While merrily drilling through your wall, make sure that you are not drilling something dangerous like an electrical wire or gas pipe, or something embarrassing like a water or telephone connection. When you get through the interior wall, pull out the hole-saw and see what else you will be drilling through before proceeding any further. It hardly ever hurts to be careful, but not being careful can really hurt bad, and almost certainly will after a while. Go with the good odds and think carefully about what you are doing.

Grounded out all the welds with a grinding stone and seperated all the E/I lams. Lost a few on each end Built a wooden form to wind all the new primary and secondaries. No, this is a good wind (excuse the pun) down project after work. I could just buy a used HeathKit HP-23 power supply for about $50.00. Building a small 6 meter linear with S2001/6146/8298 finals so I need +820V, +300V, -50V DC and 6.3V AC. The transformer I am winding orginally had 1 wrap per volt, I am considering 2 wraps per volt so the transformer should work out like this.

1200VCT 2400 wraps 26ga
500VCT 500 wraps 28ga
117V 234 wraps 20ga
100V 200 wraps 28ga
6.3V 12.5-13 wraps 16ga

Transformer was orginally out of a 650W microwave oven. Current plan is 2 6146W but I should be able to support up to 4 arranged in a semi circle so I can keep the lead length down between the tube and the tuning cap. A local electornics store also has some 12V 5A transformers wraped around a T-520 toriod core I was going to use as a choke input to the filters caps. Should provide a few heneries of inductance.

Thanks for the offer

Dennis WB3KUM/9

> Any suggestions how to prevent this from happening ?

A 4229 pot core is a Philips part number. These cores are only available in 3F3, 3C85, and 3C81 material, based on the catalog I have, all high mu ferrite materials. I show a P/N 4229PA160 with a A sub L value of 160 with a gap length of 0.103 inches. The catalog recommended use is for output chokes, and I would assume for a switch mode power supply, judging by the fact you have heating of the windings.

I guess the real question would be, do you REALLY NEED a pot core? If not, then a much better solution is to use a powdered iron core, may be in a toroid shape, for the choke. The advantage of powdered iron is the gap is "distributed" through out the whole volume of the core making a gap, to prevent core saturation due to DC current, normally unnecessary. Since the gap is distributed, any fringing flux is also distributed, along with the wire heating, so you don't have any hot spots in the winding. Also powdered iron core material is normally low mu material making the exact setting of inductance a little easier to do. The down side to using powdered iron material is the core loss tends to be higher than ferrite material.

I have used powdered iron "E" cores from Micrometals for the output filter choke in a high power Buck converter filter, where I could not get a ferrite core to work without core over heating, and winding heating from fringing flux problems.

Things have changed, no longer use heat as it will hurt the animal. They
now freeze the branding iron and then freeze the brand onto the animal.

Hi!

I had read a webpage (which I forgot to bookmark) that there is a section of compter motherboards called the oscillator module which on its own, is somethinlike like a 25mw cw txmtr on 80m. It would appear to be possible to run this through a small qrp rf amp and have something going. Does anyone have information on this or a link?

There are several off-the-shelf frequencies for these modules that
are in ham bands. Now that we are at the top of the sunspot cycle
there are lots of 28.322 MHz oscillators hooked up to antennas. Other
possible frequencies include 3.6864 MHz (serial port bit clock)
and 14.31818 MHz (VGA dot clock). People usually swipe 3.579545 MHz
crystals (NTSC colour burst) from dead TV sets.

You can get custom units if you want. I got some 62.666 MHz units
from a supplier a couple of years ago (LOs for some microwave
radios). In small quantities (< 10) they cost about the same as
a custom crystal. In OEM quantities they cost the same as the
off-the-shelf models.

The output is a TTL or CMOS square wave, which will require
filtering. The harmonics are useful for frequency markers
(I can detect harmonics of a 100 MHz unit over 2 GHz), but you
don't want to transmit them if you can at all avoid it.

Check your turns counting for the 500V winding. I think you're short a few
turns (e.g., It'll be a 250V winding with the turns you have.).

Dave

Back in the days of 4mhz Z80's the clock circuits for the cpu were right at the top of 80 meters. My ancient Trs-80 4p which I use for a packet terminal is such a beast.

The most minimal circuit along this line was a ttl inverter chip hooked up as an astable mutivibrator (ie oscillator) with a tv colorburst crystal in the loop to provided frequency stability. Luckily it was just a few milliwatts since there was no output filtering at all and you were directly keying the osc. Supposedly it could be heard within a few miles with a minimal antenna hooked to the key.
thanks, John.

One option would be to get the schematic/manual for a Kenwood TV-502 transverter, which is designed to put the TS-520 on 2 meters, and modify the design to put the output on 423 MHz.

Dave

Not exactly, but Digi-Key sells oscillator modules that can be ordered for
any frequency 1Mhz - 125Mhz for about $4 quanity 1. This is the Epson
SG-8002 module. See their catalog at http://www.digikey.com for details.

These things are a dime a dozen. Check back issues of
Dubus/UKW-Berichte/VHF Communications/QST/Radcom. Check
references like the VHF/UHF DX Book (which contains a
nice one) and the ARRL UHF/Microwave Projects manual (ditto).

I have built several transverters for 50 thru 432 and have a great deal of home brewing experience. I would never build a 432 transverter from scratch again. That freq may not be considered high any more, but it is a pain to achieve clean Osc chain output and eliminating undesired mixer by-products can lead to the funny farm. I Know Hamtronics makes a 2 watt xvter kit and I believe that Down East Microwave also has a kit version available. Both of these are as close to home brewing as you can get, but you are using proven designs. Be aware however, the HamTronics is a beast to align without a spectrum analyzer.

my 2cents
jim K4KAE

p.s.. the xvter output from the 520 is 4 mw.

Source record: 58671

1. Is the power output of a transmitter equal to the rms voltage across the load multiplied by the rms current flowing into the load.

2. If the a transmitters supply voltage is 3V then does this mean the maximum peak-peak output of the transmitter cant go above 6V (3V peak). And if so >>

3. Then does this mean the maximum output of a transmitter is limited by the supply voltage, as the max output is 6Vpp/50ohm load.

>just wires will work.
>73, Bob K6DDX

That's what I did to build a cable for my VFO-520.
I used RG-178 for the RF out,
and individual wires for the rest.
Laced it up with waxed cord -- now *there* is a lost art.

The Epson oscillators are really neat devices, and the price is right.
However, the phase noise may be too high for anything but a very low
power transmitter. A very brief test report on a couple of Epson modules
can be found on my web page.

Depends on the output network. Many 100 watt rigs operate from a 12 volt
supply. If they were limited to 24 volts p-p output, the peak voltage
would be only 12 volts, the rms voltage would be about 8.5 volts, and
the maximum power would be about 1.5 watts.

Yes, if the load is purely resistive, no reactive component.

> 2. If the a transmitters supply voltage is 3V then does this mean the
> maximum peak-peak output of the transmitter cant go above 6V (3V peak). And
> if so >>

Yes and No. If a matching transformer or network is used, the
peak-to-peak output can be greater or lesser than twice the supply
voltage. For example, if the final stage is generating 50 W, the
effective impedance is (3*3)/(2*50) = .09 Ohms. A transformer or matching
network would be required to properly load a 50 Ohm load. The RMS voltage
on such a matched load would be 50V.

> 3. Then does this mean the maximum output of a transmitter is limited by the
> supply voltage, as the max output is 6Vpp/50ohm load.

Hope I did not make too many mistakes.

Greg,
Check your email - I've scanned & sent you the diagram & pinout for the connector. You will have to get the connector & wiring stub from a dealer, as this is not a RadioShack type of plug. Otherwise, you should have all the info you need now.

BOB

Try HAKKO , You can get them from MCM and they last forever, We have 10 in
our shop and they never quit-we would never use another brand. Weller stink
and have terrible support.

I found a site one day that sold 6 meter amplifier kits and
fully wired and tested 6m amps at good prices . I lost the web
address. Does anyone know the site that I am talking about or
know any other sites like this one. Thanks, Sam

I used 4 inch PVC floor flange designed for mounting a toilet to
the floor with the appropriate fittings.

I go through the soffet and across the attic crawl space to the
shack then down through the wall into the room. The extra space
in the PVC is stuffed with fiberglass insulation and this keeps
birds, bats, and bees out.

I even have 7/8 inch hard line going through with no difficulty.

On AT power supplies,
black is ground
red is 5v
yellow is 12v
and the other two colours are -5v and -12v.

Obviously measure to make sure everything is happy.

Which is why I'd like to make a heavy load tester out of some half
burned out auto headlights. The 12v seems straight forward. Does anyone
know how many watts the average headlight is? How about when run at 5v?

From: Skipp <skipp@pilot.ucdavis.edu>
Message-ID: <8msu4g$79h$1@mark.ucdavis.edu>
Source record: 58744

Hi Tony,

One of the best meters for setting the input swr of an amplifier is the computing Autek WM-1. It shows forward power and reflected swr at the same time.

The input circuits of some amplifiers are maginal for newer solid state rigs, not so forgiving as you might say. You might need to rework the input circuit for a slightly different Q. I've done it a few times and it involves input network cap changes (remains a fixed value), an adjustable inductor, and an adjustable network output cap.

These values can be taken from the Handbook, but you might not get the information you really need for your solid state exciter. If you Email me direct, I'll try to provide you with some information to help you out.

cheers

This could be the excuse for the opportunity that you have been looking for- buying a 12 VDC to 120 VAC
inverter. The 150 watt units are quite affordable lately. I use one with my Weller soldering station.
Works great.

Has anyone considered the simplier approach of using existing technology? For example, has anyone tried an interface based on MIDI? MIDI can handle a large number of input/output channels, can quickly transfer large amounts of data, and is not controlled by a single company or organization.

While MIDI was designed for music devices, it can control all types of other devices as well (lights, stage props, and others). Therefore, I see no reason why it could not be built into a radio to handle radio control. Users would then be able to use industry standard MIDI interfaces and cables.

It would also be easier to write software if the companies agree on a common MIDI setup inside the radio (this MIDI command controls this, this command controls that, etc).

Of course, this would require radio makers to build MIDI ports into their products (and agree on a common internal setup). And, like others have said, that may be the biggest problem - most companies like the proprietary approach (they make more money by cutting out competition).

I have 1 of the type M68729 class C (i.e. FM) 30 Watts out average, 40 Watts max. These will replace older M57774 modual just fine. The input drive is 300 mW for 30 watts out. I am asking $50.00 including shipping to conus for them. RF parts wants around $70.00 for the same.

These are brand new never been used and still have the one inch leads on them.

Thank You,

Bryan Fields, KB9MCI

I have a used Pace MBT station with a standard pencil and solder sucker.
This has two regulated channels and a "snap vac" vacuum /
air compressor. About the only thing I have to complain about is
that the solder sucker plugs up from time to time (a bent paper
clip fixes works wonders to clean out the tip). Yes they are a
little pricey but if you are going to do lots of repairs or new
builds it is the only way to go.

Also pace makes lots of accessory tips and hand pieces (including
smt tweezers and hot air reflow) for this base unit so expansion
should not be a problem

just my .02$

Hi

These crystal oscillator modules can be made for any frequency you like to order. Take a trip to http://www.quartslab.demon.co.uk/ and perhaps you may liuke to place an order with them. I have used them many times and they have always been very helpful, even to the odd silly question.

You got it! My favourite soldering iron station is the Antex and an ordinary
lamp dimmer with a 1K5 5-watt resistor across it. Works a treat, lasted
years and still going strong, but I hardly dare to admit that the Antex and
lamp dimmer beats the quality of a Weller. I will still use them both.

> Would anyone care to expound on the subject of soldering stations, their
design and advantages?
==========
The primary object of the concept of a soldering iron station is to make
money for companies like Weller. It's a concept that was sold and accepted
by industry, and of course amateurs had to get in on the scene. After all,
they look really posh when you show visitors around your
factory/garage/garden_shed* (*delete inaplicable).

> As posessor of several 'irons' of 230 and 115 volt vintage, and wattages
from 65 to 15 have been
> thinking I could possibly construct something for my occasional hobby
activities. When people start

increasing wattage by approx
> 20%. Only intermittent use anyway?
==========
Agree, patially! If you are just building you bug-kit and just need
something to solder with, then almost anything will do. If you are to spend
hours on the bench or earning a living with the thing, then you need
something that is comfortable, reliable and controlable. In the words of the
tortoise in the English TV advert "I need to have everything, er! just as I
need to have it. Er! And, er, it got to be easily turn off and onable".

> Funny how they are called 'Irons' though!
==========
You used to heat them up on the gas stove, or in the furnace if you were a professional. They were also made of iron, and a lot bigger. But the technique has been around for over 1000 years.

Hi,

Being new to this news-group, can anyone please tell me where I can
find info on prop-pitch rotators, on the web?

I have obtained one and would like to find out as much info as
possible plus suitable controllers.

I looked at your page. Unless I read it wrong, your graphics show the off frequency junk to be farther down than the FCC required 40 dB. A couple of tuned circuits, and the junk would be even farther down.

Add a buffer stage for the antenna with input and output tuned/matching ciruits, and I don't see why this wouldn't make a nice little QRP CW transmitter.

You could tie the outputs of several together with an OR gate, select which one gets keyed with a rotary switch and have a simple multi-frequency QRP CW transmitter.

Control the oscillator with something like a Basis Stamp, use a little better output transistor and you would have a really simple beacon transmitter.

How about using two with some simple logic to steer the keying to make a true FSK transmitter?

Just some random thoughts for the homebrewer.

The resolution used for the spectral plots was 10.8 Hz. Although the equivalent noise bandwidth may not be exactly equal to this number, it is probably pretty close. Using a receiver with a typical CW filter bandwidth of 500 Hz, the noise would be about 17 dB higher. That places it somewhere around 30 dB below carrier. I haven't done a really accurate calibration of my IC-751A S meter. Last time I checked it was pretty close for readings above S9, and around 4 dB per S unit between S5 and S9. Going from 20 dB over 9 to S6 would indicate that the noise in a 500 Hz bandwidth is down about 32 dB at 5 kHz from the carrier. Tuned circuits would have to be awfully sharp to have much effect that close in. However, on 40 or 30 meters the oscillator might squeak in under the 40 dB limit.

In the meantime I have tried a 40 meter version of the Epson oscillator, followed by a 2N2222 final that puts out about 300 milliwatts. Haven't performed any tests to see how far down the noise is, but it sounds a lot better than the 18 MHz part. So far nobody has complained about a cruddy signal. But I've only had it on the air a couple of times, and nobody has come back to my calls, either :-)

From: stoskopf@tri.NET
Message-ID: <39940354.5CF903E2@tri.net>
Source record: 58694

Sorry, life hurts, PETA not withstanding. They stopped using hot irons mainly because the hot brand ruins a valuable part of the hide for making leather, while freezing simply makes the hair turn white. Have not been willing to do a personal comparison of the pain of burning vs freezing, but suspect both have some residual pain. Now for castrating sheep, they put a strong rubber band around the scrotum which cuts off the blood supply until a few days later when everything falls off. No cutting that way.

Things have changed, no longer use heat as it will hurt the animal. They

now freeze the branding iron and then freeze the brand onto the animal.

Maybe need to watch the modules a bit. Urban legend is that some are not crystal controlled on the output freq, but are actually oscillators phase locked to a lower freq oscillator, and they have lots of noise and spurs. Referenced in one of the CSVHF Proceedings somewhere.

My son reported to me that he was quite impressed that one of his friend's fathers still retained an old homebrew novice transmitter. What impressed him more were the "No Parking" remnants which appeared on the inside of the chasis.

How many of us removed parking signs, etc. and then used ball peen hammers to fashion into a chasis? How many used baking tins (my first 6DQ6 transmitter)?

Certainly NOT sanctioned by the folks in Newington CT.

Hi, Ed.

I've used a PCB CAD program for laying out front panels. Rather unorthodox use for the program, but it works. Also- the demo version of the program is free- check out www.ivex.com. Download the "WinBoard" demo. Just a suggestion...

Go to a metal shop and have them cut a 2" angle iron the the width of the window you wish to use. Drill 4 hole in one side to attach to the window sill where the window mates with the sill. In the upright drill the correct size hole for bulkhead (passthru) connectors of the type you are using (PL-259, N, Bnc, ect.). When the window is closed on the edge of the angle iron, drill a hole at the top edge of the window to allow a bolt type lock to be installed on top of the window, so the window can be secured.

```

For sale:

HAND-CRANKED MAGNETO GENERATORs!

Produces 120V AC. These will provide about 20-30 Watts depending on
your cranking speed! The size is
about 3" diameter and 3" deep with a retracting handle.

You can mount these behind a sturdy front panel with a single hole and
the large nut provided.

Will sell for $25.00 each, plus shipping

Pictures available.

Funny you should mention that! Not too long ago my son was dumping some 'old'
computers .i.e. at least ten (10) years old!
and wondered why I particularly wanted to keep two of the metal covers off a
couple of 286s or something!
My reply was exactly along the above lines, "In my day we'd give anything to get
nice clean sheet aluminum like that!".
Also hanging on a nail somewhere downstairs is an old stiff 19 inch rack panel
chassis with numerous tube holes and apertures. Habit dies hard just couldn't
bring myself to dump it!
Now back to renovating that 1940s, 60 year old receiver.
Terry S.
PS. 50 years from now somebody will be saying "Wonder why they never ket at
least one 'antique' 286 computer. No good for anything of course but would be
nice to see how big and inefficient they were back then"!
PPS I distinctly remember making a hole for an 'S' meter in a steel front panel
with little more than a wood working adjustable size bit and a file! I used a
magnet to try and contain the metal filings.

1642. FS: QTY 550 - Antique Radio Crystals

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-12 00:00:00 UTC
From: sabbatai_zvi@NOSPAMhotmail.com

For Sale

Antique Radio Crystals

Quantity of more than 550 crystals in various holders and by various
manufacturers.

Examples:
RadioMarine
Bliley
Motorola
Federal
James Knight
Crystal Products Co.
Western Electric
U.S. Army Signal Corps.
U.S. Coast Guard
Japanese WW2 holder

These are mostly WW2 crystals made for use with old transmitters like
the BC-610 and BC-669
Examples of the holder types in this group include:

FT-243
CR-1A
FT-171B
FT-249
Octal
FMT
Round (small)
Round (larger)
DC34

Here are some examples of the frequencies you will get - they include
even a few in the
80m and 40m ham bands, and several others just outside that could
probably be
rubbered in and used on BA rigs.

All in KC/s
1196, 1809, 1950, 1970,
2005, 2065, 2075, 2125, 2182, 2220, 2320, 2340, 2360, 2435, 2570,
2662, 2670, 2716,

3418, 3450, 3465, 3570, 3995,

5485, 5660, 5760, 5800,

6210, 6470, 6700, 6790, 6800, 6852, 6900, 6920,

7270, 7280, 7350, 7390, 7440, 7675, 7850, 7930,
10736, 15780, 140580, 140940

Many others of course. There are just too many to be able to list them all here.
They have been in storage and need cleaning up. Pictures available.

I will sell these as a complete lot for 12 cents each!

All yours for $65.00 plus UPS shipping of 35 pounds from Florida.

That seems a little steep. I was able to put together (using a transmitter module) a 8mW transmitter for less than $50. Just don't have the background to build one from scratch.

All kidding aside, those were the "Best of Times"!!! Things weren't pretty, but we somehow made them work with what we had. My plate modulator was soooo ugly that I made a wooden box to cover it up. So, next to my DX-20 was this crappy wooden crate with a mic cable running into it. It was a fun time and moments to cherish.

Rick
I have the article that goes back some 20/30 years or more
I also have made more durable modifications that have been described
in the ham papers and those already modified can easily be corrected to
same.
One way of cummunicating antenna direction is with the use of a mini camera

as they are very cheap these days($80)and showing the antenna position
on a T.V. screen via a modulator or just a std ccd screen
(Use a marked plate of a compass on the mast and a line on the screen. so
easy to correct
by redrawing if the boom slips on the mast as Murphy is a regular visitor
here)
Another way is to use a rev counter on the motor shaft by using an
extension
and use it with a cheap satellite dish driver that already has an up/down
counter
read out and direction switches and looks smart in the shack
(These vary in price at ham fests over here but $20 seems to get the job
done
You can also use the same power supply to drive the prop pitch)
These controls will need a divider because of the high gear ratio
It is best not to use any mechanism that is open to the environment
to determine direction.
I also removed the thin oil in which the gears sit and let them run dry.
I will be happy to supply any extra info that you may need via E mail to
aunwin@ice.net
Best regards
Art Unwin KB9MZ

1652. Homebrew front panel switches?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-13 00:00:00 UTC
From: bailey@cvo.oneworld.com
Message-ID: <8n7n4n$t2k@alsea.cvo.oneworld.com>
Source record: 58547

With the recent advances in printer technology it is now relatively easy to build "front panels" for equipment that look great. Has anyone developed a technique for homebrewing "switches" to be used with such a panel? I've got a couple of projects underway that need a relatively large number of logic level switches and regular panel mount switches seem to be a less than ideal solution. Perhaps something like a home made membrane "keypad"-type thing, or something that would consist of some sort of overlay on top of an etched PC board, or?

Cheers,
Kirk Bailey

From: "Mark S. Holden" <msholden@ct2.nai.net>
Message-ID: <39976B96.BE385F1E@ct2.nai.net>
Source record: 58548

Hi

My Harris Rf-550 receiver has a 1.75 mhz IF output jack, and I'd like to add a panadapter/spectrum display.

Can I mix the output of the IF out to produce a 10.7 or 21mhz signal so I can feed it into one of the more commonly available panadapters?

If it seems practical, any pointers on where to start?

If not, anyone know of a commercial panadapter that'll work with a 1.75mhz IF?

Thanks.

Mark

Sure, that shouldn't be a problem. Look through the Digi-Key (or similar) catalog for a 5-volt CPU clock module whose frequency is (your panadaptor's IF - 1.75 MHz). Use the clock module to drive the LO port of a Mini-Circuits or similar brand diode mixer -- just about any of them rated for HF use will work.

Later on you may want to add a buffer amp and/or LC filter to keep stray mixing products and harmonics from the CPU clock out of your receiver, but you don't need to worry about that unless/until it becomes a problem.

Think he was talking about pilfering the road signs.
Went out to a roadside park in search of a new chassis and found some one had
shot them all full of holes. Removed them anyway and a couple of weeks later
they were all replaced with brand new signs.

1664. Power Supplies (OT a bit)

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-13 00:00:00 UTC
From: jwodell@ameritech.net
Message-ID: <3996805f.1568558@news.det.ameritech.net>
Source record: 58637

Just bought another confounded computer power supply, and, yes,
it didn't have the EMI filter in it. And it was an expensive one. I
have six of them now that radiate better than my TS570. It wipes
out a 50KW broadcast station on AM 10 miles away.

I wonder if anyone sells the little board that they use for filtering
in good ATX supplies.

A bit OT, but so many of us use computers.....

Hey there Terry (and group),

I still have TWO XT's and a Two 286 boxes along with an Apple II !

They will still do everything they did when new (and a bit more). Cars have to be 25 years old in this state to be "antique".some of my computers already are by digital standards.

All of my antiques can serve as terminals for digital modes so this is not off topic <grin>.

I have a TS-930S Kenwood transceiver and would like to install a narrow SSB filter, the YK88SN. However, there is no provision for it. I guess I could swap it for the existing wide SSB filter but I'd like to have my cake and eat it too.

Anyone ever try this, or any suggestions?

I stripped a TV chassis and then built a pair of 6L6s with a 6AG7
Oscillator.
Had a devil of a time making it work until I replaced those little wire
wound resistors with carbon.

Then I built an electronic TR switch using either a 12AT7, or 12AT6. When I
graduated to building a Ranger from a kit I just sat the ranger on the
chassis so I could still use the TR switch for QSK. I'd say that the PS was
certainly up to a single 12AT7 after powering a pair of 6L6s which could
easil do 75 Watts.

I had a set of chassis punches so anything was fair game as long as it was
thin enough.

Yes. The original question was with regard to the power available to a
50 ohm load, and I should have indicated that my sample power
calculation was also based on that load resistance.

Once I built a 6DQ6 xtal oscillator tranmitter..the cathode bias resistor called for a 150 ohm, 3 watt unit..I put in a 5 watt wirewound.. the xmtr self-oscillated like crazy until I discovered that the wirewound was making it do that and replaced it with a carbon :-)

I hope that new EE graduates take advantage of info. like this.
Old timers know that a wirewound resistor is inductive, and hopefully
new engineers will know this intuitively thanks to newsgroup posts like this.

I have three computers within 5 feet of the HF rigs, one of which is an Icom 756Pro and the other is an Icom 751A. One computer is three inches to the left of the 756Pro, with its monitor directly above it. The monitor for this computer is directly above the Icom and the tower case is directly under it with the cover removed.

About four feet to the left and four feet behind me (less than five feet from the rig) is another tower case with the cover removed.

All three computers run 24 X 7 and do not bother the rigs at all, even with the covers removed.

They do drive my HT nuts if I bring it in the room. <:-)) (with or without covers)

YK-88SN won't fit in your 930. You need to get a YK-88SN-1 instead. The difference between those is, YK-88SN is a solder-in model and YK-88SN-1 is a plug-in model. I am not sure if there is any other difference such as the center frequency, but as far as I know this is the only difference. If you get a board, you can make it fit, but you'd better get a YK-88SN-1 because the price difference is very small.

Good story! I think many of us joined the ranks of the stupid society as
soon as we started messing with transmitters. My initiation came on a
hot, sweaty summer night while working on a homebrew 6146. I had a silver
cross on a chain around my neck. As I bent over the open rig to adjust
something, the chain hit the plate cap. Your words describe it best:

"The rig was still "ON"!! After I peeled myself off the opposite wall, I
asked myself "Are you really that stupid"? and I had to answer "YES""

>I just got a Alinco DJ-V5TH yesterday. My question is:How long should it
>take to charge the fully empty battery using the supplied charger?

According to the upper left corner on page 7 in my user manual, the
9.6v pack charges in about 11 hours. I assume that is from empty to
full, so if not dead it will not take that long. I judge my heat...
If the battery seems to be evenly heating it is probably full. And
according to caution number 6, "Unnecessary prolonged charging
(overcharging) can deteriorate battery performance."

Anybody know where I can get a decent NiMH pack(s) for the DJ-V5? None
of the usual suspects seem to have them. (Yet?) I find the 600mah of
the standard NiCd packs of near zero value!

What about mounting several of the little PC mount switches behind the
panel, and then you just need to devise the cosmetic actuators.
Perhaps small plastic rods, captive between the PC board and the front?

1684. Loose old tube bases?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-08-14 00:00:00 UTC
From: Terry Sanford <tsanford@roadrunner.nf.net>
Message-ID: <399775A4.9311DD53@roadrunner.nf.net>
Source record: 58561

Older tubes (e.g. octal glass and glass tube types and others)
sometimes have loose bases. (Seems like the old glue has dried up, and
goes dusty.)
What is the best type of glue and/or procedure to reaffix these to as
good as new.
Realise this is probably an 'old hat' question that is probably answered
in an FAQ file somewhere; but advice would be welcomed.
Hoping this the right forum to ask; thanks for any help.
Terry S.

1685. Classic SSB Book on eBay

I have the old classic "Single Side Band Handbook" on eBay with only a day or two to go. Its written by Henneberry and published by Technical Materiel Corp, 1963. If you're looking for an old classic on SSB Transmitters and receivers, this might be it.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=401993765

There's also an RSGB handbook and some vacuum tube audio books up for grabs as well.

> add a panadapter/spectrum display.

This is only practical if the IF output comes out BEFORE the selectivity filtering. If if comes out after the filters, you won't see much of a spectrum. Many receivers have IF outputs after the filters to feed fancy demodulators. If you want to use a panadaptor you really need to get the signal out just after the mixer.

Electronics World published a NiCad charger circuit in the current issue which pulse charges the cells at 200 ma for 20 milliseconds. The circuit uses an LM317 as a constant current source and an LM358 as the pulse generator (or multivibrator). The LM358 also appears to function as a comparator so that when the battery is not taking any charge it stops pulsing.

I charge NiCads at about 50ma with a homebrew constant current source so am a little hesitant to use 200ma. What are the potential drawbacks of the system described above?

I've seen this technique used with lead-acid batteries. It supposedly prevents sulfates from forming on the plates. I don't know how it works with Nicads.

This approach would work. It would be just another interface between the
radio and the computer hardware. Using a structured approach to the
software design the differences between hardware interfaces can be hidden
from the application software.

I would be nice to have one common interface type to work with, but the
computer world seems to move too fast for any one interface to become a
"standard".

Not to mention the horrible things steel panels did to meters mounted thereon. It took me a while to figure out why the plates in my 813 amplifier glowed red with only 100W input - the meters were off by about 30%. Went through two flycutter blades making those holes too. Ah yes, aluminum was definately the way to go.

This system should work well. The problem with overcharging NiCd cells is that they get warm and pressure builds. With a pulsing system this is less likely to happen.

Further, charging efficiency is better at high currents, so it's another plus for a pulse method. It will probably charge the cells faster and they will stay cooler.

Hm, maybe you can scan that diagram and post it. I might build such a thing. Or maybe that would be copyright violation...

Source record: 58574

I have an older SVGA monitor for testing computers. The monitor works, but the only color it gets is redish-orange. It's a Compaq monitor, over 5 years old and it has been in storage for as long as I had it. It had this one-color-only problem when I first recieved it (not from a store).

I opened up the case to see if I could find any knobs to turn and experiment with to fix the problem but I was disapointed to find no internal knobs labled "color adjustments" which would have helped me. LOL

The inside of the case looks good, dusty, but noting looks like it exploded in there. The monitor still looks new for it's age. Does anyone know why it might be only displaying in a redish-orange color? Any ideas on how I could fix this monitor?

Thank you all very much,

Wasn't the European standard color for mono monitors a reddish color? Here in the US you normally see green or amber, but I seem to remember there was a third color for mono screens.

If everything shows up on the screen in varying intensities when you display a multicolor graphic then it isn't a problem with the color guns or drivers. It may be a mono screen, which did get sold years ago for business purposes.

I have a vga screen that is switch selectable color or green screen. After a while manufacturers just started selling color screens for the same price as mono screens.

As I sit here thinking there also used to be mono vga screens that were black and white only, with black text on a white screen so that it could imitate paper.

Don't assume that your display is multicolor, unless you are missing parts of the display when trying to display a multicolor image.

Sort of like wondering why a tuna tin 2 won't bandswitch.
thanks, John.

Ohio Bell Telephone sponsored an Explorer Scout Group - the first thing they told you was "keep one hand in your pocket". It was a great group until they tried to describe telephone networking to us high school juniors.

That did not prevent me from being knocked on my derriere when I came in close proximity to the door knob cap in an old BW TV! Sometimes you don't even have to touch it.

As a kid I slapped together lots of gear using 1/4 inch hardware cloth. You cut and folded it to make a chassis of sorts, cut out holes as desired, soldered or bolted down sockets etc, and soldered wires or components to ground wherever needed. Kinda flimsy but a really nice way to try stuff quickly, and all you needed was a pair of side cutters!

Maybe I should try it again...

I tried clear silicone sealant a long time ago but was less than happy with the results. If the envelope of the tube ran -hot- (e.g., CCS operation of 807s, or with the tube mounted horizontally) the RTV would eventually discolor and sometimes separate from the glass via a propagating crack. (Just my own experience; YMMV, of course. Others here have recommended it, so feel free to try it.)

Two possible variations on this approach: 1) use a high temperature RTV, or 2) use a windshield RTV (e.g., Permatex 65A). Both are available from auto parts stores. The latter type is about as viscous as maple syrup and will tend to wick further down in the crevice between the base and the envelope. Down there the base may stay a few degrees cooler, and there will be greater total surface area for adhesion, in comparison to simply filling the "valley" where the envelope meets the base. Apply liberally.

3M Weatherstrip Adhesive (or the Permatex equivalent) seemed to give me somewhat better results. It had less flexure and appeared to withstand the temperature better.

But the best results I ever had were with vintage late 1970s "GC Bond," which was a very useful electronics adhesive. GC Bond had "stringy" extrusion and handling characteristics (as does 3M Weatherstrip Adhesive today), so it was difficult to force it down into the base. Fortunately, just filling the "valley" always seemed to be sufficient.

Arguably the most important step is to properly clean the mating surfaces before applying the adhesive. Use an appropriate soldering pick or similar tool and scrape away all loose cement. Lightly burnish the bakelite to remove any glaze or embrittled char where the adhesive will be applied. Apply a small amount of a suitable electronic solvent to a lint-free cloth and wipe the surfaces in question. Rinse with solvent and air it out. Apply the adhesive and prop up the tube so that its axis is reasonably concentric with the base.

(On the repair of one very loose base I left the tube on its side after applying the adhesive. The result was badly skewed.)

HTH,
Lee_K

Source record: 58580

My first tx was built from the ARRL handbook using two 1X2s spaced the correct distance for screws to hold the tube socket. 6AG7 metal osc, keyed, honeycomb coils on match stick forms. Panel lamps for meters (and occasionally holding a lead pencil to the hot end to check for output with an arc....Dad always complained that the pencils were too hard to write with.

Added a 1625 final using twisted pair between stages and wood forms about 12 inches apart. Who knows how much power, panel lamps again. Had 250 ft 450 ohm line to a dipole for 40M and on 80M fed the thing as a long wire against the phone line (ringer type) ground which was convenient in the basement. When we had a dry summer, the phone gave a tingle if someone was using it while I was on CW.

All this on a farm and 1954, pre-TV here. That was junked out to make one on an aluminlum chassis which I still have. Some day, think I will re-build the old one just for fun. And probably scare myself to death as I was keying the osc cathode and bet the voltage on the keyer button was "interesting"

It's in the September issue of Electronics World - I only started to subscribe to this in the past year because they write some great stuff.

Here is a description, you can take the nodes and connect the parts, I've simplified a bit, omitting the "discharge" circuit:

Node 0 - Ground
Node 1 - VIN (24V), 470u filter cap, 78L15 input, LM317 Input, R9(pin1)100K, Vcc of an LM358
Node 2 - 78L15 Out, 1uf Tant +, R1(pin1)3.3K,
Node 3 - R1(pin2), Pot1(pin1) 4.7k potentiometer
Node 4 - Pot 1 (wiper), R7(pin1)100K
Node 5 - R2(pin1) 10K (pin2 to GND)
Node 6 - R7(pin2), NonInv Input of LM358, C1(pin1)56nF
Node 7 - Output LM358, C1(pin2),R4(pin1)6.8k, D1(1n4148) cathode
Node 8 - R4(pin2), Green LED anode (Cath to gnd)
Node 9 - Inverting input LM358, R10(pin2)100K
Node 10-ADJ pin of LM317, Anode D1,R8(pin2)1K
Node 11-OUT pin LM317, R3(pin1)6.8k
Node 12-R3(pin2),Anode D2(1n4002)
Node 13-R10(pin1),Cathode D2, Positive Out

R1,Pot1,R2 form a voltage divider off the output of the 78L15.
R7 and C1 set the timing.
The flash rate of the LED indicates the state of charge of the battery.

Hi,

I am trying to locate a Science of cambridge (Later to become sinclair) Mk14 computer. The computer was available in a home built kit in the UK and, from what i am led to believe, many were sold to amateur radio enthusiast, as, at this time they were the only people experimenting with electonics in the home build environment. (Hence my reason for posting in this group)

If you have one, or any spares, or indeed any sinclair items ie radios, calculators, watches, etc, working or otherwise, that you would like to sell please email me as i cannot regularly access newsgroups.

I would also possibly be interested in early home computers from the late 1970 to the late 1980s. Preferably boxed but all will be considered.

Thank you in advance.

david.oharrow@btinternet.com

As a beginning TV serviceman I was out with the boss on a very old RCA
BW television with a heat-related problem. Naturally, the tube we suspected
was the one closest to the picture tube. Naturally, the boss had *me*
change the tube while the set was on. Well, I slowly got up to the tube,
wiggled it until it came loose, managed to get the old one out without
dropping it, worked in with the new tube, managed to get it into the
socket just fine. Finished and satisfied with myself, I went to pull my
hand out of there, fast. Next thing I remember was being flat against
the wall, listening to the boss laugh his butt off.

Would this be the Sinclair ZX-80? Untold thousands were sold in the US
market as the Timex-Sinclair 1000. I still have the printer and 16k rampack
though the computer seems to have gone missing.
thanks, John.

Many, many years back I owned an SX-117 and HT-44 along with the standard PS.

That power supply had two jacks for measuring the plate current.
They were across a 10ohm resistor (at least that's the value I remember)

I had to climb up on the bench/table to do some troubleshooting and the volt meter was to the right of the power supply and that was to my right. I had to reach over and move the volt meter.

Unbeknownst to me my fingers had slipped down onto the probe tips which were something like 570 volts. It didn't even tickle. That is, it didn't until I took hold of the meter case.

I remember it bit me!

The next thing I remember is waking up flat on my back down on the floor trying to get my breath. I checked my pulse before even trying to get up into the big easy chair.

I sat there a longggg time.

That was almost 40 years ago.

Then some where around the mid 70s (I had a Yaesu FT-101B to help date it). I had a 40 meter vertical out in the West yard. Just 33 feet of 1 1/2 inch TV masting on top of a pop bottle and four bare copper radials tied to an 8 foot ground rod at the base. The coax braid tied to the ground rod and radials as well.

It was spring and the ground had finally thawed to the point where I could stick the end of the radials back in as one of them had come loose and coiled up during the winter.

I took the radial, pulled it tight and bend down on my knees to stick the wire back in the ground.

As soon as my knees touched the wet ground that wire grabbed and wouldn't let go. Ya know, that hurts!
At any rate I fell over backwards and as soon as my knees left the ground I threw the wire.

It seems as if the power plug in the FT-101B had an extra large glob of solder (from the factory) that could ground out the 110 AC if the tension was at just the right angle on the cable. It was.

I was hanging onto a bare copper wire which had the other end fastened to an either foot ground rod and it had ahold of me.

This was before ground fault circuits were in general use and there was not enough current flowing to pop the breaker.

Somehow I seem to remember that back in the 1940's or so there
was advice to use Water Glass which I think is a silica compound.

Don't know where you get it but seems I remember the druggist was a
source.

> take to charge the fully empty battery using the supplied charger?
==========
Suggest you consider buying a universal battery conditioner/pulse
charger . The device takes any battery pack through an automatic
discharge/pulsed charge cycle ,which will extend the life of any
battery pack dramatically .
They are among others marketed by MAHA of Brea - CA

I have no financial interest in MAHA ,but am only a veeeerrryyyy
satisfied customer.
I ordered a new battery pack for my Icom IC-W21E HT since the old one
'seemed ' at the end of its useful life , together with the above charger.

Surprise ,surprise , pulse charging the old battery has revived the
unit miraculously .

==========
Also use both the above referred battery-powered iron as well as the
Portasol butane iron .
The first one is about right for very light PCB work but the Portasol
is a very universal iron with a number a bits up to one for
equivalent 100 Watts . There is also a small heat gun tip for
controlled heat shrinking.
By adjusting the gas stream the temperature can be varied.
An excellent tool both for inside and outside the shack .

Source record: 58590

I need a few high wattage fixed resistors:

1- 50 ohms @ 25 watts
1- 20,000 ohms @ 100 watts
1- 50,000 ohms @ 100 watts
1- 150,000 ohms @ +/-225 watts

The last resistor, 150K, is for a HB power supply and can be made up
of
2 or three resistors adding up to 150K or so. Its a bleeder and not
critical. Buy or trade.

For many years I have been using ordinary superglue. Carefully dribble
a couple of drops around the base and let it fill in around the bulb and
the old remaining putty, and that should do fine. I have never had any
problems with that method, and it is cheap.

Sadly, that is exactly what happened to one of the best of the `30's QST staff experimenters. He was working on amateur televison, but was using an open 4000 volt pole pig transformer in the HV supply, and was wearing 'fones.

It demonstrated, that all of us must be very careful, around HV, even the leaders amongst the pack.....

I've repaired several tubes, among others 6146's, with epoxy. Even
fixed loose plate caps. Never had a problem.

My mentor built my first transmitter in 1962, single tube 6146 for 80 and 40 from the '57 handbook. An RF/HV cage sat on top of the chassis. He made this from aluminum plate salvaged from a junked jukebox.

When I decided to recreate the transmitter 30 years later, I cut up the galvanized steel slide from my kids' swing set to make the RF cage. Looks great.

And yes, all this scrounging was (and is) sanctioned by the folks in Newington.

My dad (The First W3DHJ) told many similar stories that you've all
posted here. Maybe the one I remember most is a LV, Hi Amp one:

It was in the late 20's and he and his dad were working on a Ford
Service Truck. My dad got his high school class ring caught between
the battery and the frame. My grandfather picked him up bodily, and
ran over the the rain barrel at the corner of the shed -- where he
stuffed my dad's arm full-length into the water.

I remember seeing the scar on my dad's finger, still, in the nursing
home before he died.

Be careful out there!
You don't see rain barrels anymore.

Most interesting. I didn't think epoxy could take the heat. I wonder if only particular brands or formulations would work, or maybe my belief was just wrong.

Roy, I had my doubts too. However, the tube has been used off and
on over 15 years in my Viking Ranger. The epoxy has not let go yet.

I have 1 of the type M68729 class C (i.e. FM) 30 Watts out average, 40 Watts max. These will replace older M57774 modual just fine. The input drive is 300 mW for 30 watts out. I am asking $50.00 including shipping to conus for them. RF parts wants around $70.00 for the same.

These are brand new never been used and still have the one inch leads on them.

Thank You,

2 different substances.

"water glass"=A common name for a sodium silicate solution.

"isinglass"--A gelatinous substance derived from fish bladders. Used in the brewing of beer.

I have had good luck regluing loose tube bases using regular 5 minute epoxy glue, thinned with a little alcohol. Run it down between the glass and the old base cement with an eyedropper or syringe. Stretch a rubber band around the tube to hold the base in place until the glue sets up. When thinned like this, epoxy takes a lot longer (overnight) to set up. Bonds seem to hold up very well, even on a couple of 572B's that get REAL hot in operation.

You should emphasize that these are NOT 60 Hz generators. They are apparently the generators that are used for making ring voltage for telephones. Probably just fine if you don't mind the frequency being whatever you crank it to. Jim

You betcha!..I am a firm believer in the "one hand rule" too.

This reminds me of an important addition to a homebrew transmitter using a PI network output..ALWAYS include an RF choke inside the transmitter chassis, from the center conductor of the antenna connector to chaassis ground. 2.5 millihenries will do. That way, should the DC blocking capacitor in the PI network develop leakage of short completely, the DC will pass through the choke and blow the high voltage fuse in the rig (assuming it's got one..if not, please put one in! :-)) instead of placing the high voltage DC potential on the antenna.

Now I am reminded of something else...many older factory made or kit
transmitters need that choke too!

>> I have an older SVGA monitor for testing computers. The monitor works,
>but the
>> only color it gets is redish-orange. It's a Compaq monitor, over 5 years
>old

It could be an amber-color monochrome monitor..if not then you could try rebalancing the three color screens. First, make the computer driving it displays a monochrome picture of something..then locate the three (red, green and blue) screen drive potentiometers on the PCB on the neck of the picture tube and turn them all down. Next bring up the red until it shows a clear red picture. The bring up the green until the picture shows a cyan (reddish yellowish) color. Next, bring up the blue until the picture looks as close to a good black and white image as you can get. FIne tune the red and green and blue controls for the best balance.
It is possible that the blue gun in the tube might be dead, and the monitor won't show anthing but red and green..if so then you might as well chuck it. It's also possible that the blue drive circuitry needs repair.

WARNING!!!!
I don't know how experienced you are working inside monitors or TV sets, etc, so be advised: they contain extremely high voltages, on the order of 25 *thousand* volts or higher! Keep away from the red wire and suction cup that is stuck to the side of the tube! That is the high voltage feed to the tube and can knock you on your butt (or worse!)..even when the set is off! If you're not familiar with the insides of such sets then please take it to someone who is.
